The sulphide of copper when brought to the haciendas is, like the silver ore, first reduced to a fine powder in the *arrastres*; but in grinding this, much more is charged to the *arrastres* at once, and they are discharged twice in the 24 hours. The ground ore is removed from the *arrastre* to a small enclosure, where the water, with which it was ground, is allowed to evaporate spontaneously, and where it is allowed to remain exposed to the air for a length of time—sometimes two years—before being calcined. It is stated the longer it is exposed to the air, the more sulphate it will yield. I have examined various samples which had been exposed for a length of time for sulphates, but have never found any.

The furnaces in which this is calcined are called *comalillos*. They have a double hearth; the roof is almost quite flat; and the fire-place is in the centre, and runs longitudinally, so that the flame plays sideways. About eight arrobas of the ground ore (having previously had a few handfuls of common salt mixed with it) is charged on each hearth. The fire is then gradually increased, and the ore kept almost constantly stirred for the space of from six to eight hours, when the doors and other openings are closed to exclude the air. When the whole is sufficiently cold to ensure no further calcination, the ore is drawn through holes in the bottom of the furnace into a place made for its reception.

The percentage of sulphate of copper obtained by this method of calcination depends very much on the care which has been bestowed on the operation by the workmen. The following table gives the details of this operation as obtained in a few of the reduction works in Guanajuato.

Name of Haciendas.	Sulphates per cent.		Total per cent of sulphates analysed of.	Copper not analysed of.		Ore before calcining.
	Copper	Iron		as sulphide.	as oxide.	
San Joaquin	40.99	9.73	50.72	4.50	2.11	15.90
San Nicolas	20.50	12.38	32.88	2.50	.23	7.83
Granaditas	34.37	6.95	41.32	3.78	2.47	14.00
Salgado	24.64	7.40	32.04	—	2.50	8.00
Pardo	33.18	6.75	39.93	3.00	3.50	12.80
Pastita	31.62	9.05	40.67	.70	.15	8.75

In this table I give the amount of sulphate of iron as well as of the copper, because it is certain that the sulphate of iron also acts in the process of reduction, although not so perfectly as the sulphate of copper. A little of the copper given above as sulphate, will be in the state of chloride, formed by the decomposition of the small portion of salt added to the ore before calcination.

In some districts sulphate of iron is mixed with the sulphide of copper previous to calcination. By doing this, ores containing considerable quantities of carbonate and oxide of

copper may be used for the manufacture of *magistral*. The method employed by the amalgamators to know good from bad *magistral*, or rather to know the strength of it, is very rude. They take a small portion of the calcined ore in the hand; then gradually immerse the hand in water, and from the intensity of the heat given out, they judge of the quantity of sulphate the sample is likely to contain, and how much will have to be used in the process of reduction.

They also like to employ the *magistral* as soon after calcination as possible, as by standing it absorbs moisture from the atmosphere, and a larger quantity is required.

All the sulphate of copper produced in the "*apartado*"\* of the mint, from the precipitation of the sulphate of silver by copper plates, is used in the reduction works in place of calcined copper pyrites. In this case it is easy to calculate how much must be added to a *torta*, and in using this *torta* is not augmented so much in bulk as when calcined pyrites is used.

2.—*Salt*.—There are various places in the Republic of Mexico where this article is obtained, but the principal localities are *Peuon blanco* and *Salinas*. The former contains both salt lakes and springs; the latter were discovered by an English gentleman, Mr. Pollard, who was employed at this locality in extracting the salt from the earth (*Sal-tierra*) of the lakes. The following analysis made at the *Ecole des Mines, Paris*, is of the salt earth from *Peuon blanco*.

Chloride of Sodium.....	19.00	} soluble in water.
Sulphate of Soda.....	2.20	
Carbonate of Lime.....	13.60	} insoluble in water.
Carbonate of Magnesia.....	1.60	
Oxide of Iron.....	9.80	
Clay and Sand.....	46.20	
Water and Organic matter....	7.60	

100,000

This class of salt earth was formerly used without refining in the reduction works of Zacatecas, but the augmentation in the bulk of the *tortas* in consequence of so much having to be added for the purpose of obtaining the necessary amount of chloride of sodium, was very inconvenient, and its use has consequently been given up. The quantity of chloride of sodium contained in the purified salt from *Peuon blanco* averages from 80 to 85 per cent., the rest being principally sulphate of soda.

In the district of *Salinas* the salt is also found in springs. Here English and German workmen are employed to extract the salt, which they do by evaporation in large pans. The following are analyses of salt from this district, and such as is sent to the various reduction works:—

	No. 1.	No. 2.	No. 3.	No. 4.
Chloride of Sodium....	90.422	91.141	86.853	96.623
" Magnesium.....	2.520	2.538	.044	.008
" Calcium.....	1.310	1.574	.125	.114
Sulphate of Potash....	3.556	3.141	.029	trace.
" Soda.....	—	—	12.949	3.555
" Lime.....	2.192	1.606	—	—

100.000 100.000 100.000 100.000

The purest salt that is met with in Mexico is sea salt, which I have found to contain, on various occasions, as much as 98.50 per cent. of chloride of sodium; but the great cost of carriage of this salt from the coast to the interior, makes it too costly to be generally used in the reduction of silver ores.

3.—*Mercury*.—This metal, the consumption of which is very large, is almost entirely imported, although it exists in many localities in Mexico. I have seen beautiful specimens of cinnabar—red sulphide of mercury—from Mazapil, and also from the Gigante near Guanajuato, where some years ago a company was projected for the reduction of the ores; but works were never established, why I do not know. However, considerable quantities of mercury have, from time to time, been obtained from these mines. The district of El Doctor, about 150 miles to the north of the city of Mexico, has also yielded a certain quantity of this metal.

4.—*Lime*.—This is not a necessary ingredient in the *Patio* amalgamation. It is only used when an excess of *magistral* has been employed, and is then added in a caustic state, its object being to precipitate the excess of copper employed. Wood ashes are frequently added for this purpose instead of lime.

\* The name given to the Department for separating gold from silver.

5.—*Copper Precipitate*.—In many of the reduction works this is used in preference to lime for counteracting the action of an excess of sulphide of copper added to a *torta*, which it does by reducing the protochloride of copper to the state of subchloride. It is prepared by suspending a mercury bottle in a weak solution of sulphate of copper when the copper is precipitated in the form of a very fine powder. The use of copper precipitate in the *Patio* amalgamation was first proposed by Mr. Louckner, who also in conjunction with Mr. Henry Mackintosh, obtained a patent in Mexico for the use of *Copper Amalgam* in the *tortas*. The object of this was to save mercury; and if used skilfully no doubt would; the patent, however, was evaded in many instances by using precipitated copper instead of amalgam. The amalgam used by Messrs. Louckner and Mackintosh contained about 30 per cent. of copper. *Zinc amalgam* is also at times used with good results.

TREATMENT OF THE GROUND ORE (LAMA) IN THE PATIO TO OBTAIN THE SILVER.

The *Patio* is a large court yard well paved with flag carefully cemented together to prevent, as much as possible the mercury passing between them. It is made on a slight incline, so that superfluous water, from rain; &c., may run off easily.

The ground ore from the *arrastres* is collected in a place called a *cajete* until it reaches a sufficient quantity to form a *torta* or heap—which generally contains from 50 to 60 montones—60 being the general size. The monton, however, varies in different places, as under—

In Guanajuato, a monton contains....	32	quinatales.*
" Real del Monte	} .....	30 "
" Pachuca and Saco		
" Zacatecas and Sombretete	20	"
" Fresnillo	18	"
" Bolanos	15	"

When the necessary amount has been collected in the *cajete*, it is removed to a space prepared for it in the body of the *Patio*. This is an inclosure about 30 feet in diameter made by piling two or three rafters on each other, and securing them in their place by large stones; the joints being made good by horse-dung. The lama should not be much more than a foot thick; for the thinner it is, the quicker will the operation of reduction go on. Here it is allowed to remain till as much water evaporates from it as to leave rather a thin mud. This condition being arrived at, the *torta* is added (which operation is called *Ensabmorar*) in the proportion of from three to five per cent, on the weight of the ore; this, however, will depend somewhat on the quality of the salt used, and on the nature of the ores under treatment; but I now speak of salt such as that referred to in the analyses given. It is well known that those who use the sea salt, up to a certain point, will get out the silver in the shortest time. Some amalgamators will never use more than 10 per cent. salt; although they are quite aware the operation would be completed six or eight days sooner had 5 per cent. been used; but, the time gained will not compensate for the extra salt used. My friend Don Juan B. Castelazo adds by mistake to a *torta* double the quantity of salt necessary, and the consequence was that the operation was concluded in ten days instead of about 25—the usual time required in ordinary ores.

When the requisite quantity of salt has been added, the *torta* receives a *repaso* or *treading* (which will be described further on.) It is then allowed to rest till the following day when the whole of the salt ought to be in solution, and thoroughly mixed with the lama.

*Incorporar*, (addition of *Magistral* and *Mercury*).—The day after the salt has been added, they proceed (after bringing the *torta* to a proper consistency with water,) to add the necessary quantity of *magistral*. If this be of an average quality, for instance like that given in the preceding analyses, it is added in the proportion of from half to three-quarters per cent. on the ore, or about an arroba to each monton of ore in the *torta*. It is thrown as evenly as possible over the whole surface of the mass by means of wooden shovels, and when the whole has been added, the mules are admitted to *repasar*—*tread*—for about an hour for the purpose of mixing the whole as thoroughly as possible. When this has been completed, the mercury is then added in the proportion of from 3½ to 4 lbs. to every mark (half pound) of silver.

[CONTINUED ON 6th PAGE.]

\* About 22 quintals make one ton.

# MINING AND SCIENTIFIC PRESS.

## SAN FRANCISCO MINING NOTICES.

### ASSESSMENTS LEVIED.

Assessments upon Mining Stocks have been levied as follows:—

Parabaldi.—Assessment of \$1 per share, levied March 21.

Intro.—Assessment of \$1 per share, levied Feb. 23, payable March 23.

Silver Quartz Mill Co.—Assessment of 5 per cent. levied Feb. 23, payable March 28.

Idylmetia.—Assessment of 25 cts. per share, levied Feb. 23, payable March 10.

Quave.—Assessment of \$1 levied Feb. 22, payable March 10.

Rogers.—Assessment of \$5 per share levied Feb. 4, payable March 15.

Sam Wright.—Assessment of 50 cts. per share levied March 2, payable immediately, delinquents to be sold Apr. 2.

Napoleon (copper).—Assessments of \$3 per share levied March 3, payable in 30 days.

Golden Age.—Assessment of one dollar per share levied March 24, payable March 26.

Washoe Gold & Silver.—An assessment of 2 per cent. capital stock was levied Feb. 16, payable Apr. 1.

Rhodes' Diggings.—Assessment of 25 cts. per share levied Feb. 26, payable March 5.

Texas Co., at a Meeting held Feb. 14, levied an assessment of one dollar per share, payable to the Secretary in Virginia City.

Santa Rosa Co.—February assessment of 20 cents per share now due and payable.

Madison Co.—An assessment, two dollars per share, was levied Feb. 17, payable immediately, at Office, 600 Merchant St.

Union Co.—An assessment of one dollar per share was levied February 16, payable on or before March 25.

Pena Co.—An assessment of \$3 per share was levied Feb. 6, one half payable March 1, balance April 15.

Cossuth Co., Devil's Gate District.—An assessment of 10 cts. per share was levied Feb. 7.

Constitution Company levied an assessment of 25 cts. per share, payable March 11, payable immediately.

Plata Oro Co. levied an assessment of five dollars per share, Feb. 9, payable at Office of the Secretary in Virginia City.

Plata Co. levied an assessment of 50 cts. per share, Feb. 2nd, payable at Office of the President.

Lamo Co. levied an assessment of 50 cts. per share, Feb. 9, payable on or before March 20, at 115 Cal. Street San Francisco, or at office in Carson City.

Hucker Co. levied an assessment of 25 cts. per share, Feb. 11, payable immediately at 608 Merchant St.

Fawley Co. levied an assessment of one dollar per share, Feb. 9, payable on or before March 12, to Superintendent at the mine, or Secretary at Office.

Late Range Co. levied an assessment of 50 cts. per share, Feb. 4, payable, March 15.

Cross G. & S. M. Co.—An assessment of 50 cents per share was levied Jan. 27, payable at 428, Montgomery St., to the Superintendent at the mine.

White Cloud G. & S. M. Co. levied an assessment of 50 cents per share, Jan. 27, payable to the Secretary, at 502 Montgomery St.

Al Dorado G. & S. M. Co.—An assessment of One Dollar per share was levied Jan. 23, payable to the Sec. or to Supt.

Caudaloupe S. M. Co.—An assessment of \$30 per share was levied, payable on or before March 1st.

El Tesora Mining Co.—An assessment of \$1½ was levied Jan. 27, payable at office on or before Feb. 27.

Polar Star G. & S. M. Co. levied an assessment of 50 cents per share, February 4th, payable on or before the 4th of March, at the Office in this city or to the Superintendent at the mine in Aurora, (Esmeralda.)

Pio Padre G. & S. M. Co. levied an assessment of 3 dollars per share, Jan. 31, payable in 30 days, also an assessment of 2 dollars per share, payable in 60 days, at office 502 Montgomery street.

Beckwith G. & S. Mining Co.—An assessment of 25 cts. per share was levied Jan. 24, payable immediately.

Sonora Mining Co.—An assessment of 25 cents per share was levied Jan. 23, payable immediately.

Overman Mining Co.—25 cents per foot, Jan. 29, payable within ten days.

Chs. Caney Mining Co.—50 cents per share, Jan. 21, payable on or before Feb. 20th.

Sierra S. M. Co. An Assessment of \$2½ was levied Jan. 22—payable immediately, at Office 375 Mission St.

Mount David-on Co.—An Assessment of 50 cents per Share was levied, Jan. 23, payable on or before March 1st, at Office 47 Montgomery Block.

Aeratic.—Fifty cents per share, payable at No. 4 Armory Hall, San Francisco, or to the Superintendent at the Mine.

Hattie G. & S. M. Co.—Thirty cents per share, levied Jan. 31, payable at Office in San Francisco, or at the Mine.

Hale & Norcross.—Assessment of Ten Dollars per Share, levied Jan. 31—payable at the Office in this city, or to John Skae, at the Mine, on or before Feb. 25.

Mina Prieta S. M. Co.—An Assessment of Five Dollars per Share was levied, Jan. 31, payable on or before March 5th—at Office, cor. Montgomery & Jackson Sts.

Recorder Mining Co.—An Assessment of One Dollar per foot was levied Jan. 19, payable half on or before Feb. 18, and balance on or before March 20.

Hale & Norcross S. M. Co. have levied an assessment of \$5 per share payable on or before Jan. 26th.

Martin White.—An assessment of 20 cts. a share was levied, Jan. 2.

Oriental G. & S. M. Co.—An assessment of 50 cts. per share was levied, Jan. 14, payable at Office, cor. Sutton Avenue and O St., Virginia City.

Baltimore America Consolidated.—An assessment of 50 cents per share was levied, Jan. 5.

Savage.—An assessment of \$35 cents per share was levied, Jan. 7.

Hawley.—An assessment of \$1.00 per share was levied Feb. 9, payable March 12.

Cole S. M. Co.—An assessment of One Dollar per share was levied, Jan. 10, payable, Feb. 1.

United States M. Co.—An assessment of six and two-thirds cts. per share was levied Jan. 10, 1863, payable to the Superintendent at the mine, or to the Secretary, Rooms 7 and 8, Government House, San Francisco.

Sierra Nevada S. M. Co. levied an assessment of \$15 per share, Jan. 15—payable Feb. 18.

Lady Bryan.—An assessment of 70 cts. was levied, Jan. 13, payable on or before Feb. 16.

Ida G. & S. Co. (Russ District)—An assessment of \$1 was levied, Jan. 14.

### COMPANY MEETINGS.

Chs. Caney Co.—Special meeting of stockholders will be held on Wednesday, March 18, to consider the propriety of an increase of capital stock.

South Utah Co. will hold its annual meeting for election of Trustees, etc., at No. 608 Merchant St., March 20.

Nevada Co. will hold its annual meeting for electing Trustees, etc., at 608 Merchant St., March 20.

Annie Laurie Co. will hold its annual meeting for election of Trustees, etc., March 19.

### ASSESSMENT SALES.

Sales of Stock for non-payment of assessments are advertised to be sold as follows:—

Oriental Tunnel Co. will sell, on Saturday, Mar. 28.

Mars will institute proceedings against delinquents, Mar. 16th.

Planet will institute proceedings against delinquents Mar. 16th.

Meredith.—Annual meeting of stockholders will be held Monday, Mar. 16, at 2 P. M., at 712 Montgomery St.

Texas Co. will sell delinquent shares, on the 14 of March.

Meredith Co. will sell delinquent stock, March 2n.

Coso Co. will sell delinquent stock, March 18.

Moray Co. (V. City).—Suits for delinquent assessments will be commenced, March 14.

Michigan Co. (Gold Hill) will commence suits for delinquent assessments, March 16.

North Potosi Mining Co.—Sales delinquent stock will be made March 17.

Peytona G. & S. Mining Co.—Sales of delinquent stock will be made March 1st.

Cole Silver Mining Co.—Sales by Jerome Rice & Co., 327, Montgomery St., San Francisco, on the 25th of February.

Combination G. & S. Mining Co.—Sale by E. S. Spear & Co., at 433 California St., on the 10th day of March next.

Lady Bryan G. & S. M. Co.—Shares of delinquent stockholders will be sold at auction for assessments, at No. 400, Montgomery street, on Jan. 27.

Desert Mining Co.—Shares of delinquent stockholders will be sold at auction, for assessments, at No. 400, Montgomery street, Jan. 27.

### GENERAL NOTICES.

Yellow Jacket.—Corporate Deed now ready for signature at office of H. G. Maynard, Gold Hill, N. T.

Jenny Lind (Esmeralda).—Owners of ground in this Cot are requestes to call and sign deed of trust at 608 Merc. an St.

Mount Hope Co.—Persons claiming stock are requested to present title papers for examination till March 16.

U. S. Mining Co.—All persons claiming stock are requested to present title papers for examination at Nos. 7 & 8 Government House.

Caution.—D. M. Tyrell warns persons against purchasing a certain 10 feet of ground in the Wellington Co., standing in the name of J. E. Magee—also 20 feet, standing in name of W. Williams. (See Territorial Enterprise.)

Ashland Co.—L. A. Gould, in the name of the Moss Co. notifies the Ashland Co. that their westerly drift has cut the Lamb ledge, in the Moss Co.'s ground, from which the Ashland Co. is forbidden to extract any valuable metals.

Coso Silver Mining Co.—The Office of this Company has been removed from the Stevenson House to Nos. 11 and 13 Court Block, No. 636 Clay street between Montgomery and Kearny. Entrance on both Clay and Merchant streets.

THE SWEETZ Co., Gold Hill, give notice that Baltic Company have wrongfully claimed and worked their ground since July, 1860.

THE CHIMNEY ROCK Co., lying next west of the Virginia Co. claims have notified the Hazel Green, Tingley and Beach & Paxton Companies that they are trespassing upon the Chimney Rock Co's ground.

## MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

THIRD YEAR! VOLUME VI.—NEW SERIES!

A new volume of this extensively circulated paper commenced Sept. 11, 1862. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

### The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

### The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

### The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

### To Chemists, Architects, Millwrights and Farmers!

This Journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

### Terms.

To mail subscribers:—Four Dollars per annum.

### Club Rates.

Five Copies for Six Months, \$8.  
Ten Copies for Six Months, \$16.  
Ten Copies for Twelve Months, \$30.  
Fifteen Copies for Twelve Months, \$44.  
Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 80. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

### EWER & SMITH, Publishers,

Room 27, (formerly) U. S. Court Building, Corner of Washington and Battery streets, San Francisco.

C. W. THOMAS, Plaining Mill, California street, facing the Mission R. R. Depot. San Francisco.

TURNER, MARSH & OSGOOD, Successors to C. O. Turner & Co., Importers of Wines and Liquors, S. E. cor. Front and Sacramento sts.

D. R. J. B. BEERS—Dentist, 617 Clay street. All operations on the teeth performed in the most skillful and approved manner.

MRS. HALL'S VOLCANIC SMELTING FURNACE.

We would call the attention of our readers to the subjoined "card" in reference to the above invention. The well known metallurgical and scientific attainments of the gentleman whose name is thereto affixed, must attach much interest and importance to the document.

By reference to an advertisement of the proprietress in another column, it will be seen that she is desirous of making arrangements with some person of means, to erect a trial furnace, capable of smelting one or more tons of ore. We trust that some one of the many capitalists, to whom California has been generous, and who take an interest in the further development of her mineral resources, will come forward and furnish Mrs. H. with the means to give her invention a thorough, practical trial. Its success would lead to the most important results; while a failure, at the worst, would only involve the loss of a few hundred dollars in an attempt to solve a most interesting problem in practical metallurgy.

SAN FRANCISCO, MARCH 14, 1863.

MADAME:—In accordance with your polite request to give you my unbiased opinion concerning your ingenious device of a fuel, metal, and labor-saving smelting furnace; I have to particularize matters in detail in order to be understood, viz.:

The quadrangular dimension which you give your furnace outside, and the oval cavity for receiving the ore mixed up with crude lime and coals, is a contrivance well calculated to resist the inner pressure of the heat as well as to bring a considerable amount of ore into a very limited compass, to be acted upon by the intense heat thus concentrated and kept in this state up to the end of the process with a comparatively small consumption of fuel.

The moderate amount of steam, introduced by turns and the means of steam-pipes g and p, is decomposed into its constitutive parts, viz.: oxygen and hydrogen, performing this way in part the functions of a hydro-oxygen blow-pipe; the oxygen by its combining with the glowing coals augments their combustibility in a more rapid manner, and increases thus the intensity of the heat, which is still more augmented by the deflagrating hydrogen thus parted from the oxygen in the decomposed steam. Besides this change other decompositions and mutual associations also take place in this mysterious furnace, viz.: ores which are in an oxydized state, are thus forced, to give up their oxygen on the coals, which have a greater affinity for the same than any metal. By carbonates the intense heat volatilizes the carbonic acid, and by sulphates the lime depriving them of their sulphur, and combining with it as gypsum, and thus the reduction of the ore into a metallic state being complete, the fire can now freely act upon the metallic particles of the ore, which thus liquified, sink by their specific gravity to the bottom of the above mentioned cavity of the furnace and are collected in pure slugs below the aperture x.

Another attribute of great utility in your invention is the Condenser C, with the sieve O, which prevents the waste of any by the heat volatilized mineral or metal to escape through the chimney, and is collected in said condenser.

This process of reducing ores, is also a great deal accelerated by the abundantly administered air, forced from all sides into the furnace, through the judiciously distributed flues and draught holes, d, d, d, by which a great amount of oxygen, that indispensable requisite for the maintainance of the fire, is supplied with said atmospheric air, of which it forms a constituent part. If by the construction of your Smelting Furnace, on a large scale, said air flues could be put in such a position, as to conduct heated, instead of cold air into the furnace, the process would be considerably shortened and a still greater amount of fuel saved.

Having been a witness of your procedure from its beginning to its end, and seen the results of your labor, I am confident that your most clever device will revolutionise the old system of smelting ores, altogether.

Very Respectfully,  
Your Obed't Servant,

CHARLES HARASZTHY.

Mrs. ELIZA JANE HALL.

TREASURE RECEIPTS.—The amount of treasure receipts, from the interior during the ten days interim between the sailing of the two last steamers was, within a fraction of \$1,500,000; an unusually large amount for the season.

VALUABLE DISCOVERIES IN THE RUSS DISTRICT.

Mr. R. S. Whigham of this city, who has recently returned from the Russ district, has shown us a letter received from that region a few days since, which gives an extended report of the success of a prospecting party which started out from the camp of the Ida company on Owen's river, Tulare county, on the eastern slope of the Sierra Nevada, and about 100 miles south of Esmeralda. The party consisted of six. They left camp on the 26th of January, following the river in a north-easterly direction about 15 miles where they commenced prospecting. The result of which was the discovery and location of the following leads,—

The Jefferson, from 8 to 10 feet thick—argentiferous galena, galena in great abundance, rich in silver by assay.

Columbus—a gold bearing lead, in a granitic formation, from 20 to 30 inches thick—the lead rich, very friable, much decomposed, and abounds with fine gold in every part of it, as far as opened.

Chrysopolis, also gold-bearing, a well defined lead cropping out for hundreds of feet in extent, and showing gold wherever examined. The lead is about three feet thick. Oro Fino—gold much resembling the Chrysopolis, cropping out for many hundred feet, and showing fine gold abundantly on the surface.

These are all parallel ledges within a mile and a half of each other, and all convenient to the river and most eligibly located for working. The company have taken up a mill site and contemplate early efforts toward developing these discoveries. Timber and water plenty. We note these discoveries, as indicative of the extent of the still unexplored region of country east of the Sierras. The prospectors assert that there are a plenty more veins still left equally and perhaps more valuable than those already located.

The developments daily being made in every part of the State and on both sides of the mountains, are but cumulative evidence of the immensity of the yet undeveloped mineral wealth of the Pacific Coast, and may serve to give us some faint idea of the future wealth and industrial proportions which the golden State of California is destined to assume at no distant day.

LOCAL MINING EXCITEMENT.—It is said that some specimens, of silver ore have been picked up on California street, between Powell and Mason, which were taken out of the ledge of rock, now being dug away at that point in grading the street. Our "local" visited the locality but failed to discover any "ledge" or "indications" of silver. Those present stated that the "specimens" had all been taken away. According to the Morning Call, a quantitative assay made by Mr. Q. L. Hagberg, No. 420 Montgomery street, for J. R. Sprout, one of the claimants, shows 1.29-100 ounces of silver and 1.21-100 ounces of gold to the ton, the total value of which is \$38 32. This yield would not pay for working, but the company think if the outcroppings will pay even that much, better prospects may be developed by sinking a shaft, which will be done at once.

Somebody evidently has faith in the occurrence of silver ore at that locality, as a regular Stock Company has been formed, and the certificate of incorporation filled with the County Clerk. The ground claimed by the Company consists of the consolidated claims of a number of parties. The locality, beyond the limits of the street which belongs to the city, is all owned by private individuals, whose title will have to be purchased before any operations beyond "staking off" can be commenced.

QUICK WORK.—The Sonora, on her last trip to this city remained in port but 24 hours, during which time she discharged her large inward cargo, with passengers, baggage etc., and took on board 400 tons of coal for the down trip, and the ships stores necessary for the voyage, together with a full list of passengers. This is a degree of dispatch which we think must be without a parallel, and speaks well for the energy and system with which everything connected with this company is managed.

THE MOSES TAYLOR sailed promptly to her advertised hour, on the 11th instant, with an unusually large list of passengers. This boat has been put in the most perfect order throughout, and her passengers will doubtless have a most pleasant and speedy trip to the Isthmus, on their journey homeward.

COPPER SMELTING WORKS.

A company of San Francisco capitalists, has recently been incorporated with the view of erecting works for the reduction of copper ores on this coast. The company has purchased a tract of land about two miles above the junction of the Sacramento and San Joaquin rivers, upon the South bank of the latter. Among the names of the incorporators we notice some of our wealthiest and most enterprising citizens. The point selected for the works of the company is a most judicious one. It is within five miles of the Mount Diablo coal mines, and directly on the route which all the ores of the region drained by the Sacramento and San Joaquin rivers must take in reaching a market.

The company will probably put up but a single furnace to commence, which will be quite sufficient to thoroughly test the practicability of the project. The works will be erected and placed in operation under the general supervision of Mr. Price, a gentleman intimately acquainted with all the details of this intricate branch of business. Mr. Price will bring to the aid of the company the accumulated experience, which for many years has been in process of aggregation at Swansea, England, where this business has been reduced to as perfect a system and as closely economised as is practicable, at the present period of metallurgical knowledge.

Every element of success attainable on the Pacific Coast has been secured with the view to make the enterprise remunerative, if possible. The public spirited gentlemen who are advancing the capital for this operation are governed more by a desire to test the practicability of reduction works on this coast, than by a mere desire to realise a large percentage on their investment. Should success attend the effort, it will add a renewed impetus to our copper mining interest, and give value to a large proportion of ores now worthless in this market. The Company, at present, will limit their operations to a reduction of the ores to "regulus," and will not undertake any refining process until the preliminary one has resulted in success.

The shipment of treasure per Sonora was as follows:—	
To England.....	\$380,164 64
To New York.....	237,728 04
To Panama.....	5,000 00
	\$ 622,892 68
Previously this year.....	10,698,769 59
Total since Janutry 1st, 1863.....	\$11, 321,662 27
Corresponding period of 1862.....	7,376,179 10
Excess this year.....	\$3,945,483 17

MINING INTELLIGENCE.—Several of our city cotemporaries speaking of the Copper Smelting Works about to be erected near the junction of the Sacramento and San Joaquin rivers remarks that their proximity to the Mount Diablo Coal Mines will give "the new works a great advantage over those at Swansea and other places where the coal has to be procured at a great expense from abroad."

Our cotemporary, we apprehend, is not thoroughly posted. Instead of an advantage to be derived from the near proximity of "the New Works" to coal, their distance from that important material, and the great comparative cost of providing the same, will be found the chief obstacle to be encountered in making these works pay. The smelting works at Swansea, are located directly at the mouth of the coal mines, and nearly all the coal used in the furnaces are the screenings which are uneconomical, and would not pay for hauling to a market. Notwithstanding the disadvantages under which these works will go into operation, we nevertheless trust and believe, with our cotemporary that "this enterprise which is expected to be in successful operation within the next two months, will prove of great benefit to the copper mining interests of California.

"THE STOCK EXCHANGE BOARD."—The new Stock Exchange Association held their first meeting on Monday last at their rooms in Montgomery Block, and the following officers were elected: President, A. P. Sandford; Vice President, M. Livingston; Secretary, James H. Gager; Treasurer, T. D. Matthewson. There were 40 members present.

THERE is a scheme to construct another tunnel under the Alps, the point being settled at the Simplon. The total length of the proposed tunnel will be about 4506 metres.

## STOCK REMARKS.

SAN FRANCISCO, March 16th, 1883.

The Mining Market for the past week has been decidedly dull. Transactions have been comparatively light, first and second class stocks have generally declined. Stocks of lower grade have held firm to last week's quotations, and some have advanced. Many buyers have concluded, before investing further, to visit the mines and examine progress. Some have already gone, others are waiting for improved roads and more settled weather. Capital, for legitimate operations, is as abundant as ever, but there is evidently a growing disposition on the part of buyers, to exercise more caution than heretofore, and to rely more upon personal knowledge and inspection of the mines. We subjoin the transactions of the week.

## HUMBOLDT AND REESE RIVER STOCK.

There is a large quantity of Humboldt stock in the Virginia market, at low rates; but it is dealt in sparingly, and generally at private rates. Reese River seems to be attracting attention at the present time in preference to Humboldt.

## WASHOE STOCK REMARKS.

[COMPILED FROM THE DAILY TERRITORIAL ENTERPRISE.]

## MONDAY EVENING, Mar. 2nd.

The election to-day has interfered somewhat with the stock trade, and few sales are reported. A gentleman just arrived from Peavine exhibits some specimens of the recently discovered quartz in that section. One ledge, upon which a number of locations have been made, crops out at three or four points during a distance of as many miles, and is apparently forty or fifty feet in thickness. The quartz presents nothing to the eye but anthony, but assay shows silver and gold as well. The locality is some forty or forty-five miles north of Virginia. When the informant of the Enterprise left Peavine, about two hundred prospectors had arrived; and something of an excitement was brewing. The people of Dayton are also talking excitedly of a newly found range of three ledges, running near and parallel with each other, about six miles from that place. The croppings are over one hundred feet in height, and assays from them have shown in the neighborhood of \$100 in gold and silver to the ton. There is quite a stampede in that direction, we are informed. There has been a light inquiry to-day for Birdsall, at \$20; for Union, of Gold Hill, at \$25; for Beach and Paxton, at \$65 @ 70; for Oriental, at \$8 @ 9; for Fairview, at 15 @ 17, for Zouave at \$7 @ 18.

## TUESDAY EVENING, March 3d

Transactions to-day have not been numerous or very important. The Reese River mines have been a prominent topic, owing to a large yield from the Blue Ridge, in that section. Eleven hundred pounds of ore produced the astonishing result of \$1,136 in silver. The bar of bullion is on exhibition at Light's Exchange, as well as some specimens of the ore. Some fifty feet of that ledge were offered at \$25 per foot, \$20 was bid. There has been some action in Union, Gold Hill, to-day. Sixty feet sold at \$25, 15 feet at \$27 50, and 12 feet at \$30. Zouave has been in request, to fill orders from below. Forty feet sold at \$18, and 36 feet at \$20. Birdsall has been dealt in at \$20. This stock, owing to the near approach of the shaft now being sunk to the ledge, is getting into request. Bullion can be had at \$37 50 @ 40, in small lots. It is sparingly offered. Milton, although quiet, can be sold at \$75 @ 80, with little in market. Burnside is inactive, at a shade below San Francisco figures. Some very excellent looking ore is being exhibited from the Irving. Fairview can be sold at \$16 @ \$17 @ 18, but none changing hands. Beach & Paxton is still upward, but as the claim is small, it is obtained with difficulty. An immense body of ore of moderate value is exhibited. We quote it at \$75 @ 80, although there is none in market at these figures. Texas and Oriental are firm at \$8 @ 10.

## WEDNESDAY EVENING, March 4th.

Transactions have been limited, with no especial demand for anything. There has been sale for almost everything, however, in the shape of stocks.

Gold Hill shares of all kinds are meeting with favor. Union is in large demand at \$25 @ 30. Eureka, recently incorporated, is saleable at \$20. Buchanan is rating at \$75 @ 100. Bullion remains at our quotations of yesterday, with none offering. Fairview ranges from \$15 @ 17. Yolo can be had for \$10 @ 12. Sinicola may be gotten at \$9 @ 10. Zouave has been lightly inquired for at \$18 @ 20. Sixteen foot sold at \$19. Beach & Paxton can be sold at \$100. Holders are asking \$500. With so wide a gulf between buyers and sellers, we cannot hope to report many transactions in this stock within the next thirty days. Birdsall is saleable at \$20, in small lots. Twenty feet sold at these figures. Oriental is marketable at \$7 @ 8. Sixteen feet sold to-day at \$7, 19 feet at \$8 and 19 feet at \$8 50. Texas is firm at \$8.

## THURSDAY EVENING, March 6th.

The stock trade has been remarkably active to-day, and the trading has been confined to low priced shares, in which there is a growing disposition to invest. The market is abundantly supplied with capital, which is handled hastily and without discretion in some instances; but a return of the frenzy of '60 is not anticipated. The impatience of capital, however, seems to increase with the supply, and during the coming Summer more or less imprudence in investing may reasonably be looked for. There has been a light demand for Zouave at \$19 @ 20, and some 40 shares have been transferred at these figures. This stock is finding its way into the hands of heavy operators at the Ray. The Pioneer, in this district, has been dealt in to some extent to-day, and a number of feet changed hands at \$6 @ 10. We know nothing of its merits. The ledge claimed is immediately west of the Virginia. Birdsall has been marketable to-day at 20. Twenty-five feet changed hands. There are buyers of Union, Gold Hill, at \$27 50 @ \$30. Twenty-five feet were sold at the former figures. Adriatic and Harrison, Flowery District, are in request at low rates; \$3 is offered for the first and \$3 @ 4 for the latter.

## FRIDAY EVENING, March 6th.

The business of the week presents a handsome aggregate of sales, and a general advance of stocks is observable. Moscow has been one of the themes of the day. Yesterday, \$200 and \$225 were paid, and the impression prevailed that the stock would advance to \$500 before the close of the week. This expectation has not been realized. We have heard of no offer above \$200 to-day. The North Ophir prodigy has engrossed some attention. The assays are certainly large, and well calculated to excite; but the extent of the pay streak is a question upon which there is a very decided conflict of opinion. Some who have visited the claim venture to express an emphatically unfavorable opinion of its merits. It has been offered to-day at \$20 per foot, without buyers. The Yellow Jacket has advanced to \$850 @ \$500—attributable almost entirely to favorable developments. Were it free of dispute—the Union also claiming the ledge—it would reach \$1000 per foot in less than 30 days. Bullion, Burnside and Milton are inactive, and we have no transactions in either to report. Birdsall is selling in small lots at \$20 @ 22 50, and 40 feet changed hands to-day at these figures. Texas is saleable at \$7 @ 8. 10 feet sold at \$7 50. Beach and Paxton can be sold readily. 10 feet found a purchaser to-day at \$118 per share. Grass Valley is in demand at \$8 @ 10, and \$12, it is reported, has been paid. This old title is being brought up by the owners of ground which it is supposed to cover. Flowery stocks are on the advance. Adriatic is saleable at \$15 @ 20, and Harrison can be sold at twice its former rates.

Our Saturday's report has not come to hand.

The only changes we notice in Monday's report, of previous quotations, is an advance of El Dorado from \$50 to \$60, and Union, Gold Hill, from \$35 to \$40. Yellow Jacket is still improving—five feet sold on Monday for \$400 per foot.

Of the sales during the week, the following only, were submitted for publication:

- 150 feet Bodie Bluff Consolidation, on private terms.
- 5 feet Bodie Silver Hill Consolidation, terms private.
- 25 shares Gen. Hooker Consolidation for \$260

## OBITUARY.

We regret to announce the death of JAMES F. CHENERY, son of RICHARD CHENERY Esq. of this city, who died, on the 6th inst., at the residence of his Grandfather, Dr. Peck, at Northampton, Mass., aged 19, of a fever contracted in the Chickahominy swamps.

We knew him well. He was always generous, brave and kind. A great favorite among his fellows, no party or game of ball was complete without JIMMY.

[CONTINUED FROM 2nd PAGE.]

contained in the torta. This mercury is introduced in a very fine shower, by being pressed through a linen sheet so as to divide the particles as much as possible. The torta, when the mercury is added, should not be too wet, otherwise the mercury would be apt to collect into large globules again—neither should it be too dry, as the mercury in that case would become too much divided, and thus cause a larger loss than necessary in washing;—it should be of such a consistency, that the animals can, in treading, go through it with comparative ease, and yet leave the marks of their feet when removed. Immediately after the addition of the mercury the whole is again trodden for about four or five hours for the purpose of incorporating as perfectly as possible the whole mass.

When pure crystallized sulphate of copper is employed, instead of common calcined pyrites, there is added from 10 to 14 lbs. for each monoton of ore in the torta.

When the magistral and mercury have been added, and a repaso given, the torta may be said to be in working order; and it only remains for the *azoguero* or amalgamator to watch attentively its daily progress by repeatedly taking out *tentaduras*, samples:—the colour and general appearance of the mercury being the only guide to the whole operation.

A short time after the incorporo, the *azoguero* takes out a *tentadura* from the torta; washes away the earthy particles, and carefully examines what remains, which is composed of *polvillos*—metallic sulphides—and mercury. If the latter be rubbed with the thumb, or pressed through a piece of leather, but very little amalgam will remain. The colour of the mercury, in this case, is only taken notice of; and if it has altered a little from its natural colour, with a slight tinge of yellow, it is sign that sufficient magistral has not been added; or if the mercury be divided into small particles it is a similar sign. If it partakes of a lead or deep grey colour, it is evident that an excess of magistral has been added, and the torta, in such a state, is said to be *caliente*—hot—which is very prejudicial, and causes an unnecessary loss of mercury. For this reason it is always better to err in adding too little than too much magistral. If the right quantity required be put upon it at first, it is a great object gained, as the torta at once falls into good working order and goes on, barring unforeseen accidents, with but little trouble to the end of the operation. When a torta is in good working order, the surface of the mercury is of a distinct light grey colour.

[TO BE CONTINUED.]

**THE RULING PASSION.**—The local of the *Amador Ledger*, who has become very much excited with regard to the recent wonderful copper developments in that neighborhood, undertook to describe one of the beautiful mornings of the past week, and let himself off as follows:—

"On Thursday morning last the sun 'cropped out' beautifully, giving 'good indications' of a fine day", etc.

#### A STOCK BOARD IN VIRGINIA CITY.

The brokers of Virginia City have organized a Stock Board, adopted a constitution and code of by-laws and elected the following officers for the first term:—

A. C. WIGHTMAN,.....President,  
JACKSON MCKINSTRY,.....Vice "  
JOHN MCCARTHY,.....Secretary,  
W. R. SCHRIBNER,.....Treasurer.

Their first meeting for business was held on Monday last. Regular daily meetings will be held and publication of the doings thereof made through the newspapers.

**ANOTHER OPHIR.**—The denizens of Virginia City have recently been terribly excited about a wonderfully rich discovery in the "North Oylir," (Argentine District) a lead located and being worked on the Ophir grade, about a mile and a half from the Summit House. It is described as being 50 feet wide and of great richness. It has been opened about 30 feet below the surface—mostly gold, some silver. The *Enterprise* says that one and a-half feet of Savage have been given for ten feet of the new Ophia—equal to about \$20 per foot; 1600 feet in the claim.

**MINING DIRECTORY.**—We have in course of preparation a "Mining Directory," wherein will appear, in tabular form, all the Incorporated Mining Companies, which have offices in this city, the names of their Secretaries, place of office, location of mine, etc., etc. This table will be corrected monthly, and will prove of great convenience to the public. We had intended to have had it ready for this issue, but it is unavoidably postponed until next week.

### Dr. Van Zandt, Consulting Physician and Surgeon

OFFICE:

Corner of Washington and Sansome Streets.

The Great Success of this Century, as an Aid to Practical Medicine.

The Mysterious Problem of Material Nature, Electricity Made Subservient for the Cure of all Nervous and Spinal Diseases

**THAT THIS PRINCIPLE**, successfully applied to diseased states of the system, is to prove the great sought-for necessity, long wanting by physicians, to aid their medicines in overcoming organic and functional derangements of the human body. It is a part of the great principle of vitality known as nervous influence and necessarily must have much to do in obviating diseased action.

#### Too Much Cannot Be Said

In its praise, for it is highly probable that in health there is an exact equilibrium of the ELECTRIC principle; and should this secret and hidden equipoise of health be broken or lowered—should the body be negatively electrified when it should be positively charged—is not the current broken, and is there not a war of forces going on in our system? This needs correcting and in order that the tissues of the body should be susceptible to remedial agents we must first restore and

#### Awaken the Magnetic Life Within Us.

The spinal and sympathetic nerve systems. Believing as I do most firmly in this great magnetic or electrical intensity of the earth, with its influence upon our bodies in health and disease, I am led to take advantage of the press, through which to awaken attention to the subject, that good may come to all.

#### No Compromise with Disease.

Give the body strength, and nature will relieve herself. Purify the life blood, render the stomach, liver, heart, kidney and all the natural functions active by ELECTRICAL excitation, and at once the aged, the palsied, the nervous, the dispirited, the melancholic, the dyspeptic and the invalid revive under its benign influence.

#### To the Ladies of California.

Dr. Van Zandt's success with complaints of women, both in family and office practice, is owing to his correct views of the origin of all their maladies. Ladies can consult with entire confidence, as he is no speculator upon human life—but is providing himself the only member of the legitimate profession in California who is really successful in removing those ills which are the peculiar province of the sex. His high appreciation of their delicately attuned nervous organism, together with their great sympathetic life, renders him doubly able to assuage those silent complainings which they bear so patiently and so long. No social disquietude need longer afflict our home circles; for he can arouse the stricken energies; restore the wonted tonicity of the body; awaken the melancholic and desponding; and rest those drains which cause so much anxiety; cure those protean maladies which have so long

#### Baffled the Skill of Physicians.

Develop appetite, life and animation, dispel nervous headache, sinking at the stomach, wandering pains, wasting away of strength, extreme debility and lifelessness, hectic cough, sleeplessness, unpleasant dreams and that general depression of life's powers, which go to render her life a misery and death a boon. Dr. Van Zandt, with his new method of exciting the Electro-Galvanic current, together with his remedial measures which are adapted to the necessities of California, will assure you of a complete and radical recovery of all bodily and mental infirmities, and will restore you to usefulness, and spare you a blessing to your family and to society.

#### All the World Over

wherever disease exists, whether special to the soil and climate or common to all regions—epidemic or casual, acute or chronic, contagious or non-contagious—it is as necessary to restore the ELECTRO-GALVANIC equilibrium, especially in California, as it is to give food to the starving. This statement is based upon a series of facts extending through many years, and certified by hundreds of patients; so that no principle of science, no rule of experience, no result of any well known cause, rests upon more sure and unassailable foundations, than those which underlie the world-wide reputation of Electricity for the cure of all nervous states of the body, faulty digestion, mental and physical debility or prostration, coughs, asthma, wandering pains of a rheumatic, gouty or mercurial character, and all forms of disease, the result of scrofula or cachectic habit of body,

#### None Need Despair of Relief.

If you have ulcers which will not heal—pains that cannot be removed—melancholy which you cannot shake off—loss of power which you cannot regain—depression of spirits which weigh you down—wakefulness that knows no sleeping—business that languishes for want of energy—a void which no society can fill—suspicion which no assurance can allay—Go to Dr. Van Zandt, for his great success, and the safety with which he administers his new method of Electrical excitation, together with his remedies, which are adapted to the requirements of climate and constitution, will assure you a radical removal of all bodily and mental infirmities, within the scope of science and man to remove.

#### The Eye and Ear Diseases.

It must not be forgotten by the eye and ear sufferers that Dr. Van Zandt has made these afflictions an especial study, and that he is the only Surgeon in our State, who has a diploma for that branch of practice. Very many of the eye and ear troubles are purely deranged nervous actions, and are cured by his electro-galvanic battery—as amaurosis, squinting, cataract, floating specks before vision, twitching of the eyelids, nervous deafness, roaring and buzzing noises in the ears, giddiness, etc. All operations successfully done on those delicate organs of sense.

Office—Corner of Washington and Sansome streets.

Nov 29—3m

WILLIAM FELL, Notary Public for Storey County, N. T. Commissioner of Deeds for California Virginia City, N. T. my23

PALMER, HANSCOM & CO. Golden State Foundry, and Machine Works (Formerly Sutter Iron Works.) First street near Market. my23

## Mining and Scientific Press.

The MINING AND SCIENTIFIC PRESS is published at the Exchange Building, Room 27, corner of Battery and Washington streets San Francisco, Cal., at FIFTY CENTS per month, or \$4 per annum, in advance.

C. W. M. SMITH and W. B. EWER, - - - - - Proprietors.

#### Engravings, Electrotypes, etc.

We execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEREOGRAPHY and ELECTROGRAPHY, Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing. Job Work executed with dispatch at low rates. PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

### To Printers.

AN INTEREST in one of the most flourishing and best paying Newspaper Offices in the mountains is offered for sale on easy terms. A rare opportunity is hereby presented to any printer desirous of establishing himself in a good business in one of the healthiest, most thriving and delightful mountain towns in the state. For further information enquire at this office.

**SUBSCRIBE.**—Are you a miner and not a subscriber to the MINING AND SCIENTIFIC PRESS? If so, you are an annual loser of many times the price of a year's subscription, particularly if you are engaged in quartz mining. The same amount of practical information, important to miners and mechanics, which is contained in a volume of the PRESS, cannot be bought from the shelves of any bookstore in the country for the price of several year's subscription. Do you ever send a paper to the "Old Folks at Home?" If so, and you desire to send important information and valuable reading matter, you can find no paper that will be read with so much eagerness by them, or one that will convey to them so full an account of the real industry of the country as the MINING AND SCIENTIFIC PRESS. We invite all to send us their names and four dollars, or two dollars for six months, and become patrons of the only mining paper printed on the Pacific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examination, and with the hope that it may so for meet with their approval as to warrant their subscribing for it at once. It is not our usual custom to receive a subscriber for less than six months; but inasmuch as we are anxious to introduce the paper where it is not now known, we will, for the present, send the PRESS for three months even, on the receipt of one dollar, in coin or stamps. It is our belief that no one will wish to discontinue the paper after being a constant reader of it for even that short period.

#### SUGGESTIONS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in this country, is worth equally as much in England and some other foreign countries. Four patents—American, English, French and Belgian—will secure an inventor exclusive monopoly to his discovery among one hundred millions of the most intelligent people in the world.

The facilities of business and steam communication are such, that patents can be obtained abroad almost as easy as at home. The majority of all patents taken out by Americans in foreign countries are obtained through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. Having established agencies at all the principal European seats of Government, we obtain patents in Great Britain, France, Belgium, Prussia, Austria, Spain, etc., with promptness and dispatch.

Models are not required in any European country, but the utmost care and experience is necessary in the preparation of the specifications and drawings.

When parties intend to take out foreign patents, engravings should not be published until the foreign applications have been made.

**CAUTION.**—It has become a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. We caution the latter against heeding such applications as they may otherwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrust their cases to the care of a competent, reliable agent at home.

While it is true of Most European countries that the system of examination is not so rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitors, in order that they may stand the test of a searching legal examination; as it is a common practice when a patentee finds a purchaser for his invention, for the latter to cause such examination to be made before he will accept the title.

It is also very unsafe to intrust a valuable invention to any other than a solicitor of known integrity and ability. Inventors should beware of speculators, whether in the guise of patent agents or patent brokers, as they cannot ordinarily be trusted with valuable inventions.

## LOWER CALIFORNIA Colonization and Mining Company.

**THE AGENTS SENT TO MEXICO BY**  
the above Company having returned per steamer  
Oregon, after having secured a tract of upwards of

**125,000 Acres  
OF RICH AGRICULTURAL LAND,  
and a valuable silver Mine,**

The Company is now prepared to furnish exact information to Colonists who have already engaged, or those about to engage in this

### SPLENDID ENTERPRISE.

It proposes to send a vessel about the first of March next, and there being but a limited number of shares

**NO TIME SHOULD BE LOST BY COLONISTS.**

**Farmers Miners and Mechanics,**

With families are particularly invited by the authorities of the Territory. The land selected, in point of fertility of soil, is not excelled on the Continent. The climate is unsurpassed in the world. The richest silver mines known to exist in the Territory are in the immediate vicinity and bordering on the agricultural lands of the Colony.

N. B. Bear in mind that a share costs, at present, only \$200, which entitles the holder to free transportation for self, family, and articles of personal use and an equal share in the land, the Company's Silver Mine, etc. the whole enterprise, being for the mutual benefit of members only.

Full information can be had, and Mineral and Cotton Specimens seen, by applying at the Office of the Company, North-west corner of Clay and Front Street.

SAN FRANCISCO.

## Attention! Attention!

**TRACT OF LAND, EMBRACING AN AREA OF 400**  
Acres has recently been surveyed and plotted out into lots, which are now offered for sale on reasonable terms as any ever offered by the various Homestead Associations in our city. The tract is known as the "University Mount Survey," and derives its name from the fact that the Directors of the University College have selected a site of about twenty acres in the center of the tract for their College Building and Park. This property is more beautiful than any other ever offered in this market, and its location is such that it must in the natural progress of improvement soon be in great demand for places of residence. That this property will increase in value, is as certain as the future of San Francisco.

Investments in Real Estate, it is well known, have paid as largely as any other, and insurance against risk of depreciation in value is secured by the sure and rapid increase of our population.

Invest in Real Estate, and you will find it more profitable than investing in wild-cat mining stock, or loaning money that may be paid in depreciated currency. The prices for lots in the above tract will remain uniform until after the holidays—that is, without interest. The title to the land is perfect.

For further particulars apply to

**HARVEY S. BROWN,**  
No. 19 Naglee's Building.

Lithographic Maps can be seen and had at the above named office. no 13 6mo

## 50 lbs. MARINE AND Fire-Proof Paint,

**MANUFACTURED BY THE PACIFIC METALLURGICAL** Works in this city, for Hulls and Decks of Vessels, from ground Mineral Rock contains Arsenic, Copper, Litharge and six other Minerals. When used on the Decks or Bottoms of Ships, it is equal to a coat of Stone, and quite equal to Copper, no worms will ever effect it, and cheaper than any other paint.

### DIRECTIONS:

For Decks of Ships, use two parts Mineral Paint, one part White Lead, mix with Linseed Oil.

For Bottoms of Vessels, use one part ground sulphur three parts Mineral Paint, mix with Coal Tar and apply it hot.

For sale by all Ship Chandlers and Tradesmen, in boxes of 50 lbs. each, or by the Pacific Metallurgical Works.

### 25 POUNDS FIRE-PROOF PAINT.

When used on Roofs, Buildings, or Fences, it is equal to covering them with a coat of Stone, being perfectly Fire Proof, and costing less than any paint.

### DIRECTIONS:

**HOUSE:**—Mix three parts Mineral Paint with one part white lead, thin with Linseed oil: if a lighter color is wanted, mix less paint, more lead.

**ROOF:**—Five parts of Mineral Paint, one part white Lead; mix with Linseed oil. Put it thick on a tin Roof as one coat when properly applied will last three years.

S. C. BRADSHAW, Agt.,

G. T. Fouque, Superintendent.

**WORKS, North Beach; Office, 318 California st., San Francisco.**

## WRIGHT'S PICKS.

**JOHN WRIGHT,** of Sacramento, has established himself in San Francisco for the manufacture of every description of **PICKS,** of the best material, at reduced prices. PICK EYES of the best iron furnished in any quantity, at low rates. Orders from the country promptly attended to. N. B.—None genuine unless stamped with my name. **JOHN WRIGHT, 511 Market street,** Opposite Battery, San Francisco.

## REMOVAL.

**OFFICE OF THE PACIFIC METALLURGICAL** Office is removed to 318 California street. Having enlarged our Works at North Beach, we are now enabled to reduce from 10 to 15 tons of Silver or Gold rock per day.

Gold and Silver ore, and Sulphuret Assayers', or Silversmiths' sweepings reduced or purchased.

**COPPER ORES**—Highest market rates advanced in cash, for shipments. S. C. BRADSHAW, Agent,  
318 California street, near Sansome, up stairs.

## SPECIAL NOTICES.

**OFFICE OF OPHIR SILVER MINING CO.,** San Francisco, March 10th 1863.—The regular quarterly Meeting of the stockholders of this Company will be held on Wednesday, the 18th inst. at

Mar. 16-td J. H. BLOOD, Secretary.

**Office of the Tennessee Gold and Silver Mining Company,** San Francisco, March 16, 1863.—The Annual Meeting of the Stockholders of the above named Company will be held at the company's Office, No. 7, Montgomery Block, on Monday, April 6, 1863.  
mar16-td J. H. BLOOD, Secretary.

## Volcanic Smelting Furnace.

PERSONS DESIRING INFORMATION AS TO THE USE and economical properties of this Furnace, and intending to make use of the same, when satisfied of its superiority over all other means of reducing ores and separating metals from the sulphurets, can obtain all needed explanation and advice in regard to the same, and the terms of sale of rights to use the same, on application Col. J. D. Stevenson or T. Ogg Shaw, or by letter to the proprietress through the Post Office of San Francisco. Drawings may be seen at the office of Col. J. D. Stevenson, No. 614 Merchant street, or at the office of T. Ogg Shaw, in Brannan's Building, Montgomery street. The time required for reducing ores by this Furnace is from three to eight hours, and the amount of fuel only one-tenth as much as is consumed by other processes. The process of condensation is applied to this Furnace which will save all those portions of precious metals which usually escape in a volatile form. The attention of all interested in the subject is requested to examine the important results obtained by this process.

Parties wishing will be allowed to erect a trial Furnace of a capacity for smelting one ton of ore or more, on signing an obligation to pay the usual fee for the right to use it, should they continue to make use of the invention for a longer period than two months.  
mch 16 MRS. E. J. HALL, M. D., Proprietress.

**WANTED** by an Intelligent and active young man a Situation by which he may obtain an honest livelihood. He is about 16 years of age, and is a good penman. Enquire at this office. \*

## New Style of Lady's Buckle.

W. BOHM, INVENTOR & PATENTEE

THE SUBSCRIBER HAVING OBTAINED LETTERS PATENT from Washington for an improvement in the construction of Ladies' Buckles, is now ready to furnish the same in every variety of style. This buckle possesses several very important improvements over any other in use.

The invention having been carefully examined at the Patent Office, has been adjudged to be a useful improvement, and Letters Patent have been granted for 17 years. It excels all other buckles in

## Usefulness, Strength and Appearance.

The Public is respectfully invited to call and examine this Buckle at the Jewelry Establishment of

BRAVERMAN & LEVY,  
621 Washington Street, San Francisco.

## REAL ESTATE AGENT,

No. 410 Montgomery street, San Francisco.

REAL ESTATE PURCHASED AND SOLD, AND LOANS NEGOTIATED.

## WHEELER'S

## Amalgamating and Separating Pans.

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of triturating, and in cleaning up. By the introduction of the Separating Pan to follow the triturating this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

\*. These Pans may be seen in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves.  
no16-1f ZENAS WHEELER.

## JULIUS SILVERSMITH,

## Commissioner for Nevada Territory,

PACIFIC MAIL STEAMSHIP COMPANY'S line to PANAMA, connecting via the Panama Railroad with the steamers of the Atlantic and Pacific Steamship Company at Aspinwall.

## FOR PANAMA.

The following Steamships will be dispatched in the month of February, 1863.

March 21st, - - - Steamer Constitution.

Will leave Folsom Street Wharf, with Passengers and Treasure, for Panama

AT 9 O'CLOCK, A. M., PUNCTUALLY,

And connect, via Panama Railroad, at Aspinwall, with teamships for New York.

For Freight or passage, apply to

A. B. FORBES, Agent.

Je4 Corner of Sacramento and Leidesdorff sts.

## Miners' Foundry

—AND—

## MACHINE WORKS,

First St., between Howard & Folsom,  
SAN FRANCISCO.

EVERY DESCRIPTION OF IRON AND BRASS MACHINERY, the Best and Most Economical, manufactured in the state of California, will be furnished with dispatch at the Miners' Foundry and Machine Works, as:

STEAM ENGINES AND BOILERS, FLOUR, SAW AND QUARTZ MILL MACHINERY, MINING PUMPS, AMALGAMATORS, RETORTS, ETC., ETC.

Particular attention will be given to the manufacture of Machinery in Sections, designed for places of difficult access. Various models of Quartz Crushers, Amalgamators and Water Wheels—some in operation and on exhibition.

\*. Parties desiring to test their ores practically, in small quantities will be afforded ample facilities, free of cost.

All parties desiring accurate and highly finished drawings and Superior Machinery, at most reasonable rates are cordially invited to call before contracting elsewhere.

HOWLAND, ANGEL & KING.

San Francisco, February 23, 1863.

## DONAHUE'S

## Union Iron and Brass Foundry,

CORNER OF FIRST AND MISSION STREETS, SAN FRANCISCO.

The First Established in the State.

MANUFACTURE STEAM ENGINES, SAW AND GRIST Mill Machinery, Boilers, Quartz Stampers, Amalgamators, etc., at reduced prices. Have now the largest and best assortment of Gear and Machinery Patterns in the State, a list of which will be forwarded to anyone desiring it, free of cost.  
PETER DONAHUE

## Holiday Presents!

IN

WATCHES,  
DIAMONDS,  
JEWELRY AND  
SILVER WARE,

AT

## BRAVERMAN &amp; LEVY'S,

621 Washington Street,

WE CALL THE ATTENTION OF OUR FRIENDS AND the public in general to our well assorted stock of

## JEWELRY AND SILVER WARE,

Of the latest and Most Fashionable styles, which we have received by the last Steamer. Also,

## FRENCH CLOCKS,

AND

## PRECIOUS STONES,

Which we are selling, SET or UNSET, at the very LOWEST PRICES.

BRAVERMAN & LEVY,

No. 621 Washington Street,

Facing Maguire's Opera House

Dec 29 1m

## SQUARZA'S PUNCH.

## HOME MANUFACTORY.

WHOLESALE AND RETAIL,

No. 44 Leidesdorff st., near Sacramento.  
Branch at 406 Montgomery street. my30

## PALMER, HANSCOM &amp; CO.,

## GOLDEN STATE IRON WORKS,

No. 19, First Street, San Francisco,

Furnish Castings and Machinery of all kinds

ALSO:

GENUINE WHITE IRON SHOES AND DIES.

PALMER, HANSCOMB & CO.

## To Quartz Miners.

Knorr's Improved

AMALGAMATING PAN,

WITH

PALMER'S PATENT STEAM CHEST.

THE ABOVE COMBINATION SECURES THE MOST complete amalgamation of the precious metals of any process now known.

By its steam is introduced in the most effective and economical manner, while it is peculiarly adapted to the catching of floating gold and silver, known to be otherwise lost. Made exclusively by

PALMER, HANSCOMB & CO.,

GOLDEN STATE IRON WORKS,

Nos. 19 & 21 First Street, San Francisco.

The public are informed that Letters Patent have been granted the undersigned upon Steam Chest False Bottoms for the inside of Amalgamating Pans or Tubs, and are cautioned against making, buying, using or selling the same without his consent.  
W. A. PALMER.

## VULCAN IRON WORKS CO.

P. TORQUET.....MANAGER.

R. IVERS. C. R. STEIGER. S. AITKEN.

## Steam Engine Builders,

Boiler Makers, Iron Founders and General Engineers,

Nos. 137 & 139 FIRST STREET, - - - - - SAN FRANCISCO.

STEAMBOAT MACHINERY built and repaired; also Saw Flour and Quartz Mills, Pumping and Mining Machinery, etc., etc., etc., etc., etc.

Proprietors of Morse's Patent Fire Grates, JOFVAL, FOURNEYON and other Turbine Water Wheels, with latest improvements.

## DEETKEN'S

## Chemical and Metallurgical Works,

On San Bruno Road, Islais Creek,  
SAN FRANCISCO.

GOLD BEARING SULPHURETS WORKED AT REASONABLE RATES. ALL THE GOLD EXTRACTED by Chemical process. Yield of Sulphurets from 20 to 50 per cent higher than the BEST AMALGAMATING PROCESS.  
Apparatus for separating Sulphurets set up by experienced hands at a cost of \$50 to \$100, if desired by mill owners. No power nor clean water required for its purpose.  
nov8-3m

## LEWIS COFFEY AND RISDON,

## STEAM BOILER AND SHEET IRON WORKS.

The only exclusively Boiler Making Establishment on the Pacific Coast Owned and conducted by Practical Boiler Makers. All orders for New Work, the repairing of Old Work, executed as ordered, and warranted as to quality.

Old Stand, corner Bush and Market Streets, Opposite Oriental Hotel, San Francisco, Cal.

LEWIS COFFEY

J. N. RISDON.

## JAMES PHELAN,

(LATE J. & M. PHELAN.)

## IMPORTER AND JOBBER,

## Wines, Liquors, Etc., Etc.,

Nos. 616 & 618 Front street,

Between Jackson and Pacific Streets,  
Established 1849. SAN FRANCISCO.

All Goods Guaranteed. Orders Solicited  
TERMS LIBERAL. Jan. 1-1f

## For Sale Cheap!

A HORIZONTAL STEAM ENGINE OF 4-Horse Power, Flue Boiler, in excellent order capable of driving a ten stamp mill, for sale at half its original cost. Apply to

JULIUS SILVERSMITH,

Federal Building, cor. Battery and Washington Sts

Room, No. 23.

Whilst thankful for the former confidence bestowed upon me, I desire to say that I am ready to make and repair with cheapness and dispatch everything in my line of business; especially all kinds of apparatus used in Breweries and Distilleries; also, all such as are used where steam, spirits, or pumps of any kind be required. Also, Kitchen utensils for Hotels, Restaurants and private houses. Baking apparatus for Bakers and confectioners, as well as all other kinds of copper work.

All orders from the country promptly attended to.

[FROM THE LONDON "MINING AND SMELTING MAGAZINE."]  
THE MEXICAN METHOD OF AMALGAMATION.

BY JAMES NAPIER, JUN., F. C. S.  
Late Chemist and Assayer to the Guanajuato Mint, Mexico.

[CONTINUED.]

The day after the *incorporo* (should the magistral have been added in proper proportion,) a very different appearance is presented in the *tentadura*. There is found collected mercury which when pressed by the thumb yields amalgam of silver; and what is in the first trial *desecho*—broken up mercury—appears now as what is termed *limadura de plata*, of a whitish colour, and in the form of thin plates or leaves which, if rubbed with the thumb, will be found to consist of dry silver amalgam called *pasilla*. It is from the appearance of this that it is known when the operation is going on well. If *pasilla* be formed in a very short time after the ingredients have been added, it is certain they have been added in proper proportions.

To make a *tentadura*, about 1 lb. of the lama taken from various parts of the *torta*, is put into a *jicara* and slowly washed in water contained in a convenient vessel. The *jicara* is gently moved about in a peculiar manner so that the lighter part only is washed away, leaving in the *jicara* the *limadura de plata*, (small leaves of amalgam); the mercury with its *lista*, or tail; and a portion of the *polvillos*, or heavier metallic sulphides of iron, &c. There is now added to the *jicara* about a tea-cup full of clean water; when it is inclined to one side in the hand, and a gentle but peculiar movement given to the water so as to arrange the contents of the *jicara* in the following order:—The *limadura* or broken up *lis* of mercury should occupy the first or upper part; the metallic portion of the ore should be below this; and, last of all, the mercury and amalgam as a large globule. As I have stated before, the *limadura* is the most important part, and is inspected first; this is done by holding the *jicara* in the right hand in an inclined position, and rubbing the *limadura* with the thumb of the left hand, at the same time observing with great care its colour—the facility with which it can be converted into amalgam by the friction—and of the consistency of the resulting amalgam, that is to say, whether it contains a large or a small amount of mercury. The metallic portion, or *polvillos*, is not of much importance, as the state of the amalgamation cannot be judged of from it. The globule of mercury at the bottom is lastly examined as to the colour, and the quantity of amalgam which it contains is ascertained by pressing it with the thumb on the side of the *jicara*.

These *tentaduras* are commonly taken from the surface and interior of the *torta*. The surface is always the most forward from its being most exposed to the action of the air and sun. Three *tentaduras*, or trials, are made of each *torta* daily; one in the morning before commencing to tread; one after it has been trodden for some time; and a third after the treading is finished.

When the operation approaches conclusion, that is to say, when nearly the whole of the silver capable of being taken up has been extracted, the *limadura* becomes *weak*, and upon being rubbed with the thumb shows but little amalgam. When it ceases to do so altogether, feels soft, and combines into small globules which run down to the bottom of the *jicara*, the amalgamation may be considered finished or *rendido*. However, in some cases, a *torta* may show the signs in this respect of being finished, when in reality it is not; for this reason, the *asciento*, (metallic portion, or *polvillos*, remaining in the bottom of the *jicara*), is also examined by extending it out over the *jicara*, and rubbing the small prills collected there with the finger. If these unite into running mercury, then there is no doubt about the operation being finished; but should they form dry amalgam, it is not so, and the operation must be continued until such is the case.

If the *beneficio* (amalgamation) be low or cold, these signs are deceptive; consequently it is better to carry the *torta* rather hot than cold. At the present day the amalgamators, besides being guided by the above signs, also make an assay of the *torta*, by taking as average a sample as possible from the heap—washing it and collecting the whole of the mercury and amalgam, and having it assayed. By this means it can be easily calculated how much silver the whole of the mercury present ought to contain.

*Treading; and turning over the Torta.*—The operation

of treading is carried on almost exclusively by mules or horses; and it is repeated every other day until the end of the operation. One mule to every two *montones*\* is about the number employed. They are tied together four abreast, and blinded, and a man stands in the centre of the *torta*, holding a halter attached to the animals to guide and direct them through the mass. They first commence to tread at the edge or border of the *torta*, and very gradually work in to the centre, which ensures the whole mass being thoroughly trodden. The operation lasts from about 6 o'clock in the morning till about 1 or 2 in the afternoon. Besides this treading, the *tortas* are also turned over twice a week by men, by means of wooden shovels. This is done on one of the days of the treading, and is commenced immediately on the removal of the animals from the *tortas*.

Animals are kept exclusively for the purpose of treading; and very frequently, when they become old and die, a ball of amalgam, weighing at times many ounces, is found in their stomachs. This is easily accounted for, for when they come from a *torta* they often commence to lick themselves, probably for the salt which may adhere to their bodies, to which also a considerable quantity of very finely divided amalgam may have attached itself. This latter passes into the stomach where, in the course of years, it accumulates into a large piece. These pieces of amalgam are extremely heavy and solid, and vary in size from a small nut to a large egg. The animals, as soon as they have finished treading, are well washed in a large tank of water.

It is believed by many that no means of *repasso* or treading, except that of animals, can be effectual, the reason assigned being that animals have the power of imparting or exciting a slight electrical action in the mass. This, however, has been entirely disproved by some amalgamators using machines in place of animals, and obtaining equally good results. I have no doubt machines will, before long, be entirely used, in stead of animals, for this purpose.

*Washing*—Where the amalgamation is considered complete, some amalgamators, previous to washing the *torta*, add to it a portion of fresh mercury which is called *bano*—bath—for the purpose of collecting as much as possible the finely divided amalgam. However, others prefer using a larger quantity of mercury in the *torta*, from the commencement and adding no *bano*. The next thing to be done is to separate the amalgam from the vast amount of earthy matter with which it is associated, which is done as follows, in most of the well conducted works:—There are arranged in a shed—*lavadero* or washing-house—three large round tanks, built close together in a circle, and communicating with each other by means of an oblong opening about 13 inches high and  $8\frac{1}{2}$  inches wide, commencing at about a foot from the bottom, and terminating at about the same distance, or a little more, from the top. These tanks—*tinajas*—are built of stone-slabs, which have to be carefully cemented together, particularly those at the bottom, as much of the mercury might be lost. In the centre of each tank there is an upright shaft, carrying four cross arms, to which are attached long wooden teeth or stirrers, the whole being moved by one mule. The pinions which move the agitators of the second and third tank are a little larger than that attached to the first, so as to give them rather a slower motion. The tank into which the metallic mud is first thrown is called *la tina cargadora*—(the changing tank)—and the last one the *descargadora* or discharger. The *torta*, before being washed, is divided into a certain number of parts; each part, before being taken to the washing-room, being softened with water and a treading. A given portion—which is measured by large wooden bowls—of the lama is thrown into the first tank (*cargadora*), water being allowed to run in and the machinery being made to revolve rapidly (the driving mule going at a gallop) at the time of changing, so as to break up and separate the whole mass as much as possible. Little by little the mule is made to go gradually slower and slower, till at last it only moves at a gentle walk: the mules being specially trained to the different paces required. From time to time the *azoguero* removes a portion of the slime under treatment, and washes it in a *jicara*:—from the amount of mercury remaining at the bottom—which at last ought to be a mere trace—it is judged when the water holding the earthy particles in suspension may be run off. This is done by opening a large plug near the bottom of the last tank—*descargadora*. When the whole is run off, the plug is again

put in, and the operation continued in a similar manner till the whole *torta* has been washed.

Besides the fluid amalgam which remains at the bottom of the *tina*, there is also a quantity of the heavier portions of the ore—*cabetilla*—which is very rich in amalgam. This is removed in wooden bowls to a tank—*pila apuradora*—and thrown into a large bowl called a *batea apuradora*; these vary from three to five feet in diameter, and float on the surface of the water. The person who manages this *batea* leans over the side of the *pila*, and with a hand on each side of the *batea* manages to give a peculiar shaking or rocking motion, at the same time constantly dipping up a small quantity of water, which he washes round the *batea* and then throws out, carrying with it a portion of the *cabetilla*.

This is repeated till there is collected from 20 to 30 lbs. of *pella*—amalgam—which is carried to the *azoguera* (mercury house,) where it is deposited in a large stone trough. When the whole of the amalgam from a *torta*, or as much as the trough will conveniently hold, has been collected, a large quantity of pure mercury is added, and also a gallon or two of water. Two men next thrust their right arms into the amalgam and stir it about in every possible direction for some time, for the purpose of cleaning it as much as possible. Every now and again the matter which collects on the surface is removed, as is also the water, and the operation repeated time after time until the surface of the amalgam presents a bright smooth surface, when it is very carefully wiped with a woollen cloth.

*Pressing Amalgam or Pella.*—When the amalgam has been properly cleaned as above, it is removed into a cone-shaped *bag-manga*—made of sail-cloth with an outer covering of leather on the sides. This *manga* is hung from a beam, and the excess of mercury filters through the canvas bottom into a trough beneath it. The amalgam is allowed to remain in the bag, as a general rule, about two hours, when it is emptied out on to a table. It now presents the appearance of very fine sand; and in this state is next beaten into iron moulds, and formed into bricks—*bolos*—of about three or four inches thick, and wedged-shaped, so that when six of them are placed together they form a circle, leaving a round hole in the centre for mercurial vapours to pass through in the next operation.

*Burning.*—The final operation is to expel the last traces of mercury from the silver, which is done under a large copper bell. Below the floor of the burning house there is a tank, through which a stream of cold water is constantly flowing. In this a round tripod is placed, on the top of which is laid a round iron plate, with a hole in the centre, about two inches in diameter. On the top of this is placed the *bolos* of silver, as high as the bell will admit, there being a space of about an inch left between the silver and the side of the bell. This is now lowered on to the top of the silver, the joints at the bottom being well secured. There is next put round the bell (leaving a space of about six or eight inches) mud bricks or *adobes*; the intermediate space being filled with charcoal. This is now ignited, and as the heat increases the mercury begins to pass off into a receptacle below. The fire is kept up for about 12 or 15 hours, when the whole is allowed to cool, and the bell removed. The silver is then found to have a beautiful honeycomb appearance, and is called *plati pina*. In this state it is removed in leather bags to the government melting and assay office to be run into bars.

It may be worthy of remark that silver produced by the *patio* amalgamation is purer than that produced by any other method. I have often seen it produced in Guanajuato as fine as that specially prepared in London for check silver.

The duration of the amalgamation process is very various, and depends on many circumstances. About 25 days may be taken as the average time to work a *torta*.

*Loss of Mercury.*—There are two sources of loss of mercury in this operation. One is called the *consumido*, or the portion required to reduce the silver to the metallic state; in practice, weight for weight is allowed, the correct proportion being as 100 is to 108. Every thing lost beyond this is called "*perdida*." It may be taken as a general rule that from 10 to 16 ounces of mercury are sacrificed for each mark (8 ounces) of silver obtained.

[CONTINUED ON 6TH PAGE.]

## SAN FRANCISCO MINING NOTICES.

### ASSESSMENTS LEVIED.

Assessments upon Mining Stocks have been levied as follows:—

Garabaldi.—Assessment of \$1 per share, levied March 2nd.

Sutro.—Assessment of \$1 per share, levied Feb. 23, payable March 23.

Silver Quartz Mill Co.—Assessment of 5 per cent. levied Feb. 23, payable March 28.

Helvetia.—Assessment of 25 cts. per share, levied Feb. 17, payable March 10.

Zouave.—Assessment of \$1 levied Feb. 22, payable March 20.

Rogers.—Assessment of \$5 per share levied Feb. 4, payable March 15.

Sam Wright.—Assessment of 50 cts. per share levied March 2, payable immediately, delinquents to be sold Apr. 2.

Napoleon (copper).—Assessments of \$3 per share levied March 3, payable in 30 days.

Golden Age.—Assessment of one dollar per share levied Feb. 24, payable March 26.

Washoe Gold & Silver.—An assessment of 2 per cent. on capital stock was levied Feb. 16, payable Apr. 1.

Rhodes' Diggings.—Assessment of 25 cts. per share levied Feb. 26, payable March 5.

Texas Co., at a Meeting held Feb. 14, levied an assessment of one dollar per share, payable to the Secretary in Virginia City.

Santa Rosa Co.—February assessment of 20 cents per share now due and payable.

Madison Co.—An assessment, two dollars per share, was levied Feb. 17, payable immediately, at Office, 600 Merchant St.

Union Co.—An assessment of one dollar per share was levied February 16, payable on or before March 25.

Pena Co.—An assessment of \$3 per share was levied Feb. 5, one half payable March 1, balance April 15.

Kossuth Co., Devil's Gate District.—An assessment of 10 cts. per share was levied Feb. 7.

Constitution Company levied an assessment of 25 cts. per Feb. 11, payable immediately.

La Plata Oro Co. levied an assessment of five dollars per share, Feb. 9, payable at Office of the Secretary in Virginia City.

La Plata Co. levied an assessment of 50 cts. per share Feb. 2nd, payable at Office of the President.

Alamo Co. levied an assessment of 50 cts. per share, Feb. 11, payable on or before March 20, at 115 Cal. Street San Francisco, or at office in Carson City.

Tucker Co. levied an assessment of 25 cts. per share, Feb. 11, payable immediately at 608 Merchant St.

Hawley Co. levied an assessment of one dollar per share, on Feb. 9, payable on or before March 12, to Superintendent at the mine, or Secretary at Office.

Slate Range Co. levied an assessment of 50 cts. per share, Feb. 4, payable, March 15.

Moss G. & S. M. Co.—An assessment of 50 cents per share was levied Jan. 27, payable at 428, Montgomery St., or to the Superintendent at the mine.

White Cloud G. & S. M. Co. levied an assessment of 75 cents per share, Jan. 27, payable to the Secretary, at 428, Montgomery St.

El Dorado G. & S. M. Co.—An assessment of One Dollar per share was levied Jan. 23, payable to the Sec. or to the Supt.

Gaudaloupe S. M. Co.—An assessment of \$30 per share was levied, payable on or before March 1st.

El Tesora Mining Co.—An assessment of \$1½ was levied Jan. 27, payable at office on or before Feb. 27.

Polar Star G. & S. M. Co. levied an assessment of 50 cents per share, February 4th, payable on or before the 4th of March, at the Office in this city or to the Superintendent at the mine in Aurora, (Esmeralda.)

Dios Padre G. & S. M. Co. levied an assessment of 3 dollars per share, Jan. 31, payable in 30 days, also an assessment of 2 dollars per share, payable in 60 days, at office 502 Montgomery street.

Beckwith G. & S. Mining Co.—An assessment of 25 cents per share was levied Jan. 24, payable immediately.

Sonora Mining Co.—An assessment of 25 cents per share was levied Jan. 23, payable immediately.

Overman Mining Co.—25 cents per foot, Jan. 29, payable within ten days.

Chs. Caney Mining Co.—50 cents per share, Jan. 21, payable on or before Feb. 20th.

Sierra S. M. Co. An Assessment of \$2½ was levied Jan. 22—payable immediately, at Office 575 Mission St.

Mount David Co.—An Assessment of 50 cents per Share was levied, Jan. 23, payable on or before March 1st, at Office 47 Montgomery Block.

Airatic.—Fifty cents per share, payable at No. 4 Armory Hall, San Francisco, or to the Superintendent at the Mine.

Hattie G. & S. M. Co.—Thirty cents per share, levied Jan. 31, payable at Office in San Francisco, or at the Mine.

Hale & Norcross.—Assessment of Ten Dollars per Share, levied Jan. 31—payable at the Office in this city, or to John Skar, at the Mine, on or before Feb. 25.

Mina Prieta S. M. Co.—An Assessment of Five Dollars per Share was levied, Jan. 31, payable on or before March 31st—at Office, cor. Montgomery & Jackson Sts.

Recorder Mining Co.—An Assessment of One Dollar per foot was levied Jan. 19, payable half on or before Feb. 18, and balance on or before March 20.

Hale & Norcross S. M. Co. have levied an assessment of \$5 per share payable on or before Jan. 26th.

Martin White.—An assessment of 20 cts. a share was levied, Jan. 2.

Oriental G. & S. M. Co.—An assessment of 50 cts. per share was levied, Jan. 14, payable at Office, cor. Sutton Avenue and C St., Virginia City.

Baltimore America Consolidated.—An assessment of 50 cents per share was levied, Jan. 5.

Savage.—An assessment of \$35 cents per share was levied, Jan. 7.

Hawley.—An assessment of \$1.00 per share was levied Feb. 9, payable March 12.

Cole S. M. Co.—An assessment of One Dollar per share was levied, Jan. 10, payable, Feb. 1.

United States M. Co.—An assessment of six and two-thirds cts. per share was levied Jan. 10, 1863, payable to the Superintendent at the mine, or to the Secretary, Rooms 7 and 8, Government House, San Francisco.

Sierra Nevada S. M. Co. levied an assessment of \$15 per share, Jan. 15—payable Feb. 18.

Lady Bryan.—An assessment of 70 cts. was levied, Jan. 13, payable on or before Feb. 16.

Ida G. & S. Co. (Russ District)—An assessment of \$1 was levied, Jan. 14.

### COMPANY MEETINGS.

Chs. Caney Co.—Special meeting of stockholders will be held on Wednesday, March 18, to consider the propriety of an increase of capital stock.

South Utah Co. will hold its annual meeting for election of Trustees, etc., at No. 608 Merchant St., March 20.

Nevada Co. will hold its annual meeting for electing Trustees, etc., at 608 Merchant St., March 20.

Annie Laurie Co. will hold its annual meeting for election of Trustees, etc., March 19.

### ASSESSMENT SALES.

Sales of Stock for non-payment of assessments are advertised to be sold as follows:—

Oriental Tunnel Co. will sell, on Saturday, Mar. 28.

Mars will institute proceedings against delinquents, Mar. 16th.

Planet will institute proceedings against delinquents Mar. 16th.

Meredith.—Annual meeting of stockholders will be held Monday, Mar. 16, at 2 P. M., at 712 Montgomery St.

Texas Co. will sell delinquent shares, on the 14 of March.

Meredith Co. will sell delinquent stock, March 2nd.

Coso Co. will sell delinquent stock, March 18.

Moray Co. (V. City)—Suits for delinquent assessments will be commenced, March 14.

Michigan Co. (Gold Hill) will commence suits for delinquent assessments, March 16.

North Potosi Mining Co.—Sales delinquent stock will be made March 17.

Peytona G. & S. Mining Co.—Sales of delinquent stock will be made March 1st.

Cole Silver Mining Co.—Sales by Jerome Rice & Co., 327, Montgomery St., San Francisco, on the 25th of February.

Combination G. & S. Mining Co.—Sale by E. S. Spear & Co., at 433 California St., on the 10th day of March next.

Lady Bryan G. & S. M. Co.—Shares of delinquent stockholders will be sold at auction for assessments, at No. 400, Montgomery street, on Jan. 27.

Desert Mining Co.—Shares of delinquent stockholder will be sold at auction, for assessments, at No. 400, Montgomery street, Jan. 27.

### GENERAL NOTICES.

Yellow Jacket.—Corporate Deed now ready for signature at office of H. G. Maynard, Gold Hill, N. T.

Jenny Lind (Esmeralda).—Owners of ground in this Cot are requestes to call and sign deed of trust at 608 Merchant St.

Mount Hope Co.—Persons claiming stock are requested to present title papers for examination till March 16.

U. S. Mining Co.—All persons claiming stock are requested to present title papers for examination at Nos. 7 & 8 Government House.

Caution.—D. M. Tyrell warns persons against purchasing a certain 10 foot of ground in the Wellington Co., standing in the name of J. B. Magee—also 20 feet, standing in name of W. Williams. (See Territorial Enterprise.)

Ashland Co.—L. A. Gould, in the name of the Moss Co. notifies the Ashland Co. that their westerly drift has cut the Lamb ledge, in the Moss Co.'s ground, from which the Ashland Co. is forbidden to extract any valuable metals.

Coso Silver Mining Co.—The Office of this Company has been removed from the Stevenson House to Nos. 11 and 13 Court Block, No. 636 Clay street between Montgomery and Kearny. Entrance on both Clay and Merchant streets.

THE SWEETZ Co., Gold Hill, give notice that Baltic Company have wrongfully claimed and worked their ground since July, 1860.

THE CHIMNEY ROCK Co., lying next west of the Virginia Co. claims have notified the Hazel Green, Tingley and Beach & Paxton Companies that they are trespassing upon the Chimney Rock Co's ground.

## MINING AND SCIENTIFIC PRESS.

**THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.**

**THIRD YEAR! VOLUME VI.—NEW SERIES!**

A new volume of this extensively circulated paper commenced Sept. 11, 1862. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

### The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

### The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

### The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

### To Chemists, Architects, Millwrights and Farmers!

This Journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

### Terms.

To mail subscribers:—Four Dollars per annum.

### Club Rates.

Five Copies for Six Months, \$8.

Ten Copies for Six Months, \$16.

Ten Copies for Twelve Months, \$30.

Fifteen Copies for Twelve Months, \$44.

Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 80

Names can be sent in at different times and from different Post-offices

A CHAPTER TO INVENTORS AND DISCOVERERS.

The whole community is benefitted by the promotion of the useful arts, and, therefore, it is for the public good to hold out the promise of rewards to the inventors of new and useful arts and manufactures, who may first put the public in possession of them. It is true that by such a grant as a patent makes—a monopoly for a time—every other person is restrained during the continuance of the monopoly from using the invention, even if he makes a similar discovery himself. But at the time the grant is made, it is by no means certain that the invention will be given to the public, or even made by any other person; and by the temporary suspension of their right, the people acquire the certainty of being able to use the invention at the expiration of the monopoly. Utility to the public is, in fact, the consideration of every grant for the sole use of an invention, and letters-patent containing such grants always state the public good to be the motive in making the grant.

Hence, therefore, the total absence of utility to the public, in any invention, will at all times vitiate a grant of the sole use of it. But it will not be void on that ground if it were useful to the public, although such utility may be very small.

But an invention may be of some use to the public, and yet be so trifling or frivolous, that the inconvenience arising from a grant of the sole use of it would not be adequately compensated by the benefit which the public would receive from it. The law, therefore, has deemed it right that mere discovery of any new manufacture shall not vest the sole right to use it in the inventor; but that to be entitled to such privilege he must obtain a grant from the Government, who have the right of judging, not only whether the invention is likely to be of sufficient utility to warrant its being made a matter of public concern, but also the duration of the privilege it merits.

There is reason to believe, though it is not positively known, that the practice of making grants of the sole use of inventions originated in England, and that it has thence been copied more or less closely by other nations. It is a power derived from the common law of England; and this law has been modified by statute in modern times both in England and other countries. (Hindmarch on Patents, 3.)

No person can be the grantee of a privilege in an invention except the true and first inventor. To be capable of supporting such a grant the patentee must be the person who has not only actually invented or imported the invention, but who has been the first to give it to the public.

In England it is held that the first importer of an invention from abroad may have a patent. (Edgeberry vs. Stephen, 2 Salk., 447; Dav. P. C. 36.) This, however, is not the case in the United States. Here the inventor alone can get a patent. He is deemed the first inventor who first gives, or contracts by patent to give, a knowledge of it to the public. And the fact of first introducing an invention is *prima facie* proof of first invention. Although a patentee's claim to be the first inventor will not be defeated by the prior discovery of the same thing by one who kept it secret, yet it is otherwise if the invention was known to be used by the public at any time before the date of the patent.

If the inventor himself publishes a knowledge of it, the law deems that he thereby dedicates it to the public; and when once the publication has been made the act is irrevocable, and a patent can-

not be granted, or if granted will be useless. And if the public becomes possessed of a knowledge of it by any means whatever, no patent can be granted.

WORKING SILVER ORES.

Our next issue will conclude the valuable treatise on the Mexican Pateo process of working silver ores, which we have been for several weeks republishing from the "London Mining and Smelting Magazine." The concluding portion, which will be given next week, is devoted chiefly to the *philosophy* of the various manipulations, and will be found both valuable and interesting. Although this somewhat lengthy paper may be rather dry and uninteresting to the general reader, it will be found of much value and importance to all who are practically engaged in the difficult and intricate business of extracting silver from its ores. Notwithstanding, as intimated by the author of the treatise, much of the tedious Mexican hand and mule process may now be more advantageously and economically performed by the aid of machinery, still the primitive modes of manipulation employed years ago, by the Mexican miners, may be profitably studied even at the present day. There is little doubt, but that the general principles of the "Patio process," modified and accelerated by modern machinery, will prove the most economical and effectual method of working silver ores, which in the present condition of metallurgical and chemical knowledge, can be devised. We again commend to all interested a careful perusal of the treatise referred to. It will be found of as much value to the prospector, as to the "process man." It will be found almost invaluable to the prospector who would arrive at a practical knowledge of the value and character of his mine. It can be obtained in no other publication in this country, than the SCIENTIFIC PRESS. We have extra files of the Press, from November last, which will be furnished at the regular subscription price, and which contain much reliable matter, other than the treatise upon working silver ores.

THE DIOS PADRE MINING CO.

The mine belonging to the Dios Padre Company is situated in the Alamos District, State of Sonora, Mexico, and adjoins the celebrated mine of Almadre, 75 miles from the port of Santa Barbara. There is a good wagon road from the port to the mine.

This company was organized in November 1862, with a capital stock of \$960,000, divided into 1920 shares of \$500 each. The Company holds 2400 feet in length. The vein is a very heavy one being about 40 feet wide, and has been opened by a shaft to the depth of 220 feet, which is substantially walled from the bottom up. The mine is so situated that it may readily be drained by a tunnel to the depth of about 500 feet. A mill to be driven by a seventy horse power is now in process of construction. Ten stamps will be put up at first, to be subsequently increased to forty. Wheelers' amalgamating pans and separators will be employed. The mill will be ready to start about the first of June next. About \$75,000 have been expended in opening the same and erecting the machinery.

The Company's office is at No. 10, Armory Hall, in this city, and the present officers, are Ira P. Rankin, President; T. A. Talbert, Treasurer; J. F. Nesmith, Secretary, and Ira P. Rankin, E. W. McKinstry, T. A. Talbert, C. H. Bradford, D. Maddux and F. Shackley, Trustees.

STOCK BOARD IN SACRAMENTO. A Board of Stockbrokers has been formed in Sacramento. The meetings will be held daily from 2 to 3 P. M. at Court House Block. The terms of admission for the present are fixed at \$25 initiation fee and \$3 monthly dues.

TRIFLES LIGHT AS AIR.—The winds which come over to us from America have at all times held in their loftiest currents, and carried over to us that remarkable dust which they sweep up from the summit of the Andes, or the arid pampas of South America. The dust has been deposited on the north coast of Africa, on the Pyrenees, and even on the snow clad fields of our Alps; and in it, in our days, a German natural philosopher has discovered atoms of American soil, of Brazilian rocks and thousands of the small light bodies of microscopic animals from the banks of the Orinoco.—*Kohl's Discovery of America.*

MINING STOCKS IN VIRGINIA CITY.

The stock excitement which, within the last two or three weeks has been gradually declining in San Francisco seems to have been transferred to Virginia City. The business of that place for the week ending with Saturday March 14, footed up at about \$250,000. Nearly every class of stocks in that city are advancing, and many who have hitherto kept aloof from mining speculation, have caught the infection, and are converting all their surplus cash into "feet." The recent extraordinary successes of several of the first class mines, and the rapid advance of stocks generally, has been the exciting cause of this sudden activity. There appears to be no limit to the amount of capital, home and foreign, offered for investment. The number of transfers during the week under review were very numerous, and embraces a large variety of companies, some of which are seldom heard from in stock transactions. Gold Hill stocks, of second and third class, seem to have come in for an unusual share of attention. The various lawsuits in pendency appear to have caused some fluctuations in such stocks as were thereby affected, as favorable or unfavorable rumors were set on foot. The legal differences between the Burning Mountain and Madi-on seem to embrace a large share of attention, both there and in this city. Several mammoth "cards" have been put forth by the friends of the contending parties, much to the pecuniary benefit of a leading San Francisco daily. Our compilation of "Remarks" for the week, which will be found in another column, is very full, and affords abundant evidence of a most unusual degree of activity.

NEW AMALGAMATOR.

A new gold and silver amalgamator, containing several new and important principles in its construction, may be seen at work every day, at the Miners' Foundry, on First St. This amalgamator has been patented by Mr. West, a practical Washoe silver ore worker. One of the prominent features in this pan, is the introduction of a copper steam-pipe around the inside circumference, which operates as a most admirable collector of the amalgam, nearly all of which is always found at every "clean up" adhering to this pipe. When the amalgam is once brought in contact with it no action of the machine can again separate it, but it remains permanently fixed, until the pan is cleaned up. Other improvements have also been introduced in the shape and movements of the mullers. We would advise quartz men to call and examine this pan for themselves. The results of the operation of this pan as compared with those now in general use are said to be greatly in its favor. It can be obtained at the Miners' Foundry.

LIST OF MINING COMPANIES.—We give, on the first page of the present issue, a partial list of Incorporated Mining Companies, which have their offices of business in this city. There will undoubtedly be found many inaccuracies in the list, which we shall correct as fast as they may be discovered or whenever they may be handed in to us. Secretaries of Companies, and others interested, will confer a favor by sending to this office a memorandum of any errors or omissions which they may notice. A number of additional companies will appear in the next issue. We shall continue the table from week to week until it is correct and complete.—after which time it will be published monthly and corrected, as changes and additions occur.

THE "OREGON" FOR MEXICAN PORTS.—The steamship Oregon, Captain Wakeman, sailed for Mazatlan and Guaymas Monday. This vessel was completely loaded with machinery and merchandise for those ports, and had to refuse large quantities of freight offered. The machinery on board was ordered by mining companies which were composed almost exclusively of Americans. It is stated by parties in the boiler and machinery business that enough of those manufactures is already ordered to occupy all the room on board the Oregon which may be available for such purposes on her next trip. A large number of passengers went down who profess intending to engage in mining operations.

We are indebted to Hon. A. A. SARGENT for several valuable public documents, and for other favors.

## WASHOE STOCK REMARKS.

[Compiled from the Daily Territorial Enterprise.]

MONDAY EVENING, March 9, 1883.  
There has been considerable life in low priced stocks to-day, and a large number of transfers have been made. Harrison, Geller Ledge (the incorporated portion) has been inquired for at \$8 @ 10, and fifty or sixty feet have been sold. Large lots are in request at these rates. This outlook for activity is doubtless based on an intent to force the Harrison into prominence as a contestant for the Madison-Moscow ledge. The Hazel Green has been dealt in at \$4 @ \$6, with large orders from below; 50 feet sold at \$4 50; 25 feet at \$4 75; and 30 feet at \$5. Birdsall is also in brisk demand at \$20, with little in market; 19 feet sold to-day at \$21. Yellow Jacket is firm at \$350 @ 400; five feet sold at the latter figures. El Dorado is saleable at \$55 @ 60, with an upward tendency. For Union (Gold Hill) \$35 @ 40 is offered, with little disposition on the part of holders to sell. Texas is selling at \$7 @ 7 50; 40 feet sold at \$7. Grass Valley, 25 feet sold at 9 50. Zouave is in high request at \$19 @ 20; 700 or 800 shares are now held in San Francisco.

TUESDAY EVENING, March 10th, 1883.  
There has been considerable animation in mining shares to-day, and a number of heavy transfers are reported. Union, Gold Hill, advanced \$15 during the day and \$50 @ 55 is offered this evening. Probably 151 feet changed hands at from \$48 to \$55. Bullion is in light demand, and 37 feet were sold at \$40 @ 42 50. Hazel Green has sold pretty extensively at \$4 50 @ 5, and is still saleable at these figures, to fill orders from below. Belvidere has been inquired for to-day, 100 feet sold at \$20. Beach & Paxton is advancing steadily. It is saleable at \$175 @ 260 per foot. There has been some inquiry for Burnside at a shade below San Francisco quotations; without sellers.

WEDNESDAY EVENING, March 11th.  
This has been a day of excitements—not one of two, but of a dozen at least. Everything—positively everything—is advancing, and money is freely offered for investment. Gold Hill stocks have been the especial rage, although Virginia has not been neglected. First, let us speak of Gold Hill. The Eureka has been sought for at a healthy advance. In the morning it was sold at \$25, but it reached \$40 by 4 o'clock P. M., at which figures it may be fairly quoted. Not less than 200 feet changed hands. Leon, a claim which yesterday might have been bought at \$4 and 5, is now saleable at \$20, with as many buyers as sellers. The Leon is located in front of Crown Point. The Overman has been in request all day at \$12 @ 15, with abundance of buyers. Not less than 250 feet were sold. The Belcher has also been in lively demand, and is saleable at a decided advance. Little has changed hands, owing to a disposition on the part of owners to hold. A very rich ledge has been struck near and in front of the Sinaloa, and supposed to be a distinct vein. It assays largely, and has created something of an excitement. Twelve feet sold to-day at \$75 per foot. Yellow Jacket is quiet. It is offered in small lots at \$325 @ 350 without takers. We now turn to Virginia. The Meredith suddenly advanced to \$40 to-day, and the tendency is still upward. The ledge in the lower tunnel of the mine has recently been struck, we understand; hence the advance. The Belvidere has been marketable at \$20, with a number of sales at these figures. Birdsall is in brisk demand at 22 50 @ 25; 39 feet sold at 22 50. El Dorado

is saleable at \$67 50 @ 60, with little in market. This stock is on the advance. Zouave is dull at \$20. No transfers in this stock are reported. Osceola is in request at \$10, with sales of 50 feet. Kenosha can be sold at \$10, and sales at a higher rate are reported. A ledge, about two miles west of Virginia, has just been located by the "Breta Company." The locality is new. An assay of the croppings shows \$47 50, principally in silver. The holders are somewhat excited.

## THURSDAY EVENING, March 12th.

There has been considerable less feeling in stocks to-day than yesterday, although the shares dealt in are scarcely less buoyant. The certainty of a conflict with the Belcher has somewhat cooled the ardor of the owners in the newly developed vein in front of the Sinaloa, at Gold Hill, but the price of the ground is still maintained, and none has changed hands to-day in the market. The Belcher and Overman are still in demand—the former at \$25 @ 30, and the latter at \$15, with more buyers than sellers. The Sinaloa and Leon are in request—the latter at \$20. We quote Yellow Jacket at \$325, and Union at \$50. El Dorado and Birdsall have had something of a run to-day. El Dorado is in demand at \$75, with few sellers. Birdsall has advanced during the day to \$35, with abundance of buyers. Meredith may be quoted at \$40. Kenosha has been selling at \$15, and is in demand, owing to favorable indications in the tunnel of the mine. Beach & Paxton is saleable at \$200, with little in market. Burnside is in request at \$50, with no sellers; \$70 to 75 is asked. Hazel Green is dull at \$5, Zouave at \$20, Oriental at \$7 @ 8, Texas at \$7.

## FRIDAY EVENING, March 13th.

Little has been done in stocks to-day, in comparison with the early part of the week. Over excitement, inevitably reacts in prostration. This is a financial as well as a physical fact. Trade is quiet in Gold Hill. The Bay State engrosses attention, and the Overman and Belcher are in demand. Massion is being dealt in at \$10 @ 12, and a sale of twenty-five feet is reported at \$15. The Princess, adjoining the Union, is finding buyers at figures not reported. In Virginia but few sales are reported, and none of these at advanced rates. For Burnside \$50 is offered without accommodation. South Burnside is saleable at \$6 to 7. Birdsall is still maintained at \$35 @ 40 with little in market. A small lot of Beach & Paxton sold to-day at \$300 per share. This is first sale of this stock reported for some weeks. Twenty-five feet of Rogers, Virginia district, sold at \$40. We quote El Dorado at \$70 @ 75; Meredith at \$40; Sacramento at \$60 @ 62 50; Kenosha, \$15; Osceola, \$10; Santa Rita, \$35 to 40; Oriental, \$8; Hazel Green, \$5; Keystone, \$15 @ 20; Pride of Washoe, \$15 @ 20; Zouave, \$19 @ 20; Belvidere, \$20; Fairview, \$15 @ 20; Bullion, \$40 @ 45; Union, \$50; Buchanan, \$100; Yellow Jacket, \$300 @ 325.

## SATURDAY EVENING, March 14, 1883.

The business of the week foots up largely, stocks to the amount of not less than \$250,000 having changed hands since Monday. Burnside is in high request at \$50, with few sellers. South Burnside is saleable at \$6 @ 7. There is something of a demand for Madison at a shade below San Francisco quotations, but the rumor of a compromise is not implicitly credited, and it is dealt in cautiously; thirty-five feet sold at \$28 @ 30. Birdsall is in request at \$37 @ 40. 25 feet sold at these figures. The possibility of a suit with the Dargan has somewhat depressed the Oriental, and it is offered at figures below our last quotations. Bullion is quiet, with an upward tendency. Eighty feet sold yesterday at \$45. Peytona is in demand at \$30 to 35, and Kenosha at about our last quotations. Beach & Paxton is held for a heavy advance. There is considerable action in Gold Hill stocks. Bay State cannot be bought for less than \$100 per foot. Leon is marketable at \$20 @ 25. Dunn is held at \$10 @ 11. Branch Mint is in demand at \$25. Union is quoted at \$50. The following sales are reported by Platt & Low, of Gold Hill: 12 feet Fuller at \$15; 5 feet Eureka at \$30; Hawkeye at \$15 @ 20; 50 feet Overman at \$20; Mussellon, \$3 @ 12.

[CONTINUED FROM 2nd PAGE.]

**Loss of Silver.**—The loss of silver in this amalgamation process is considerable and varies much according to the class of ores operated upon, and particularly on the quality of the grinding, on which depends very much the success of the operation. From 10 to 14 per cent. is an average loss on docile ores; much of this, however, is lost in the form of amalgam from being carried away in fine particles by the water used in washing the tortas; but if more perfect washing vats were employed I have no doubt but the loss of silver could be much decreased.

[TO BE CONCLUDED NEXT WEEK.]

\* monton 32 quintals.

## THE ESMERALDA MINES.

We condense the following from the *Esmeralda Star* of March 14th:

The Pond Ledge on Last Chance Hill, far exceeds anything yet struck in the District for richness in the precious metals. The shaft on this lode has reached a depth of 100 feet, and not a dollar of assessments has the company been compelled to levy in the working of it. Some of the rock will yield several thousands of dollars to the ton. The ledge is about nine feet thick and enlarges as it goes down; the rock is decomposed quartz. The lode is 1200 feet in length, and no danger of conflicting with any other lode.

The mount Braley Company have just commenced running their tunnel, and we understand that the work will be continued day and night.

New Esmeralda is being prosecuted with energy. The Company owning it have gone through one ledge about fourteen feet in width, and will probably get through three more in about thirty days, when they will commence drifting and taking out ore for crushing. The Company intend putting up a large mill this spring.

The Montreal Tunnel, which is located a short distance below the Heath quartz lode, has now reached a distance into the hill of one hundred and thirty feet. This tunnel was located as early as December 1861, and will be one of the best paying enterprises in the District, as it is owned by working men who are determined to push the work with vigor.

The Portland ledge, on Martinez Hill, is turning out excellent rock; a shaft has been sunk 46 feet, and the ledge is now five feet wide. We learn also that the Polar Star is turning out splendid rock, but the owners, J. B. Herbert & Co., have been compelled to suspend work, not being able to find workmen to work even at the high rate of \$12 per foot in sinking the shaft.

The Golden Cross lode on Last Chance Hill, is being worked day and night, and the rock is hauled to Gregory's mill for crushing. This ledge is 1200 feet in length, and is one of the best on the hill; the result of the crushing we have not yet learned—the rock is rich and the company owning it say there is no reason why the mill should not prove it to be so.

**MINERS WANTED.**—Three hundred miners at least are wanted at the present time, and there is or will be an increased demand for men. Work has been compelled to be suspended on some of our best lodes, for lack of workmen. The mills are sadly in need of hands. \$4.50 per day is the wages of miners, and four for men to work in the mills. The Last Chance Tunnel, being run into the hill of the same name has reached a distance in the hill of sixty feet, and is being run day and night. The Tunnel is admirably located for prospecting the hill and reaching the many blind lodes known to be running through the hill.

The General Hooker quartz lode, situated on Silver Hill, between the Antelope and Utah, is still yielding rich rock.

The upper shaft is now down to the depth of fifteen feet and the ledge about three feet in width. Ten dollars per ton has been offered for all the rock taken out by the company, delivered on the ground. The company, we are informed, are free from debt, and have never yet levied any assessments.

There is a scheme to construct another tunnel under the Alps, the point being settled at the Simplon. The total length of the proposed tunnel will be about 4506 metres.

**MINING DIRECTORY.**—We have in course of preparation a "Mining Directory," wherein will appear, in tabular form, all the Incorporated Mining Companies, which have offices in this city, the names of their Secretaries, place of office, location of mine, etc., etc. This table will be corrected monthly, and will prove of great convenience to the public. We had intended to have had it ready for this issue, but it is unavoidably postponed until next week.

## Dr. Van Zandt, Consulting Physician and Surgeon

OFFICE:

Corner of Washington and Sansome Streets.

The Great Success of this Century, as an Aid to Practical Medicine.

The Mysterious Problem of Material Nature, Electricity Made Subservient for the Cure of all Nervous and Spinal Diseases

**THAT THIS PRINCIPLE**, successfully applied to diseased states of the system, is to prove the great sought-for necessity, long wanted by physicians to aid their medicines in overcoming organic and functional derangements of the human body. It is a part of the great principle of vitality known as nervous influence and necessarily must have much to do in obviating diseased action.

### Too Much Cannot Be Said

In its praise; for it is highly probable that in health there is an exact equilibrium of the ELECTRIC principle; and should this secret and hidden equilibrium of health be broken or lowered—should the body be negatively electrified when it should be positively charged—is not the current broken, and is there not a war of forces going on in our system? This needs correcting and in order that the tissues of the body should be susceptible to remedial agents we must first restore and

### Awaken the Magnetic Life Within Us.

The spinal and sympathetic nerve systems. Believing as I do most firmly in this great magnetic or electrical intensity of the earth, with its influence upon our bodies in health and disease, I am led to take advantage of the press, through which to awaken attention to the subject, that good may come to all.

### No Compromise with Disease.

Give the body strength, and nature will relieve herself. Purify the life blood, render the stomach, liver, heart, kidney and all the natural functions active by ELECTRICAL excitation, and at once the aged, the palsied, the nervous, the dispirited, the melancholic, the dyspeptic and the invalid revive under its benign influence.

### To the Ladies of California.

Dr. Van Zandt's success with complaints of women, both in family and office practice, is owing to his correct views of the origin of all their maladies. Ladies can consult him with entire confidence, as he is no speculator upon human ills—but is proving himself the only member of the legitimate profession in California who is really successful in removing those ills which are the peculiar province of the sex. His high appreciation of their delicately situated nervous organism, together with their great sympathetic life, renders him doubly able to assuage those silent complainings which they bear so patiently and so long. No social disquietude need longer afflict our home circles; for he can arouse the stricken energies; restore the wonted tonic of the body; awaken the melancholic and desponding; arrest those drains which cause so much anxiety; cure those protean maladies which have so long

### Baffled the Skill of Physicians.

Develop appetite, life and animation, dispel nervous headache, sinking at the stomach, wandering pains, wasting away of strength; extreme debility and listlessness, hectic cough, sleeplessness, unpleasant dreams and that general depression of life's powers, which go to render her life a misery and death a boon. Dr. Van Zandt, with his new method of exciting the Electro-Galvanic current, together with his remedial measures which are adapted to the necessities of California, will assure you of a complete and radical recovery of all bodily and mental infirmities, and will restore you to usefulness, and spare you a blessing to your family and to society.

### All the World Over

wherever disease exists, whether special to the soil and climate or common to all regions—epidemic or casual, acute or chronic, contagious or non-contagious—it is as necessary to restore the ELECTRO-GALVANIC equilibrium, especially in California, as it is to give food to the starving. This statement is based upon a series of facts extending through many years, and certified by hundreds of patients; so that no principle of science, no rule of experience, no result of any well known cause, rests upon more sure and unassailable foundations, than those which underlie the world-wide reputation of Electricity for the cure of all nervous states of the body, faulty digestion, mental and physical debility or prostration, coughs, asthma, wandering pains of a rheumatic, gouty or mercurial character, and all forms of disease, the result of scrofula or catarrhic habit of body.

### None Need Despair of Relief.

If you have ulcers which will not heal—pains that cannot be removed—melancholy which you cannot shake off—loss of power which you cannot regain—depression of spirits which weigh you down—wakefulness that knows no sleeping—business that languishes for want of energy—a void which no society can fill—suspicion which no assurance can allay—Go to Dr. Van Zandt, for his great success, and the safety with which he administers his new method of Electrical excitation, together with his remedies, which are adapted to the requirements of climate and constitution, will assure you a radical removal of all bodily and mental infirmities, within the scope of science and man to remove.

### The Eye and Ear Diseases.

It must not be forgotten by the eye and ear sufferers that Dr. Van Zandt has made these affections an especial study, and that he is the only Surgeon on our State, who has a diploma for that branch of practice. Very many of the eye and ear troubles are purely deranged nervous actions, and are cured by his electro-galvanic battery—as amaurosis, squinting, cataract, floating specks before vision, twitching of the eyelids, nervous deafness, roaring and buzzing noises in the ears, giddiness, etc. All operations successfully done on those delicate organs of sense.

Office—Corner of Washington and Sansome streets.

nov 29—3m

**WILLIAM FELL**, Notary Public for Storey County, N. T. Commissioner of Deeds for California. Virginia City, N. T.

**PALMER, HANSCOM & Co.** Golden State Foundry, and Machine Works (Formerly Sutter Iron Works.) First street near Market. my 23

**ORO HOTEL**, Fire-Proof Brick Building, No. 49 K street, Bet. Second and Third, Sacramento City. Jas. Smith, Prop'r. my 30

## Mining and Scientific Press

The MINING AND SCIENTIFIC PRESS is published at the Esch Building, Room 27, corner of Battery and Washington streets, San Francisco, Cal., at FIFTY CENTS per month, or \$4 per annum, in advance. C. W. M. SMITH and W. B. EWER, Proprietors.

### Engravings, Electrotypes, etc.

We execute at this Office Engravings and Illustrations on wood, at copper, steel, etc. STEREOGRAPHIC and ELECTROTYPING. Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Mills, Steel Plate or Colored Printing. Job Work executed with dispatch at low rates. PATRONS will remember that when we execute engravings we will in them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best advertising Medium to be found in the country.

### To Printers.

AN INTEREST in one of the most flourishing and best paying Newspaper Offices in the mountains is offered for sale on easy terms. A rare opportunity is hereby presented to any printer desirous of establishing himself in a good business in one of the healthiest, most thriving and delightful mountain towns in the state. For further information enquire at office.

**SUBSCRIBE.**—Are you a miner and not a subscriber to MINING AND SCIENTIFIC PRESS? If so, you are an loser of many times the price of a year's subscription, particularly if you are engaged in quartz mining. The amount of practical information, important to miners, mechanics, which is contained in a volume of the PRESS, cannot be bought from the shelves of any bookstore in the country for the price of several year's subscription. Do you send a paper to the "Old Folks at Home?" If so, and desire to send important information and valuable read matter, you can find no paper that will be read with so much eagerness by them, or one that will convey to them so accurate an account of the real industry of the country as the MINING AND SCIENTIFIC PRESS. We invite all to send us their names and *four dollars, or two dollars* for six months, become patrons of the only mining paper printed on the Pacific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examination, and with the hope that it may so far meet with approval as to warrant their subscribing for it at once. It is not our usual custom to receive a subscriber for less than six months; but inasmuch as we are anxious to introduce the paper where it is not now known, we will, for the present, send the PRESS for three months even, on the receipt one dollar, in coin or stamps. It is our belief that no one will wish to discontinue the paper after being a constant reader of it for even that short period.

### SUGGESTIONS ABOUT FOREIGN PATENTS

American inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in his own country, is worth equally as much in England and some other foreign countries. Four patents—American, English, French and Belgian—will secure an inventor exclusive monopoly of his discovery among one hundred millions of the most intelligent people in the world.

The facilities of business and steam communication are such, that patents can be obtained abroad almost as easy as at home. The majority of all patents taken out by Americans in foreign countries are obtained through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. Having established agencies at all the principal European seats of Government, we obtain patents in Great Britain, France, Belgium, Prussia, Austria, Spain, etc., with promptness and dispatch.

Models are not required in any European country, but utmost care and experience is necessary in the preparation of the specifications and drawings.

When parties intend to take out foreign patents, engagements should not be published until the foreign applications have been made.

**CAUTION.**—It has become a somewhat common practice among agents located in England to send out circulars soliciting patronage of American inventors. We caution the inventor against heeding such applications as they may otherwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrust their cases to the care of a competent, reliable agent at home.

While it is true of Most European countries that the system of examination is not so rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitor in order that they may stand the test of a searching legal examination; as it is a common practice when a patentee fails to purchase for his invention, for the latter to cause such examination to be made before he will except the title.

It is also very unsafe to intrust a valuable invention to other than a solicitor of known integrity and ability. Inventors should beware of speculators, whether in the guise of patent agents or patent brokers, as they cannot ordinarily be trusted with valuable inventions.

## LOWER CALIFORNIA

Colonization and Mining Company.

THE AGENTS SENT TO MEXICO BY the above Company having returned per steamer after having secured a tract of upwards of

125,000 Acres

RICH AGRICULTURAL LAND, and a valuable silver Mine,

Company is now prepared to furnish exact information to Colonists who have already engaged, or those who wish to engage in this

## SPLENDID ENTERPRISE.

proposes to send a vessel about the first of March, and there being but a limited number of shares.

NO TIME SHOULD BE LOST BY COLONISTS.

Farmers Miners and Mechanics,

and families are particularly invited by the authorities of the Territory. The land selected, in point of fertility, is not excelled on the Continent. The climate is unsurpassed in the world. The richest Silver is known to exist in the Territory are in the immediate vicinity and bordering on the agricultural lands of the Territory.

Be, Bear in mind that a share costs, at present, only \$200, which entitles the holder to free transportation for self, family, and articles of personal use, and an equal share in the land, the Company's Silver Mine, etc. The whole enterprise, being for the mutual benefit of the shareholders only.

All information can be had, and Mineral and Cotton Minerals seen, by applying at the Office of the Company, North-west corner of Clay and Front Street.

## Attention! Attention!

A TRACT OF LAND, EMBRACING AN AREA OF 400 Acres has recently been surveyed and plotted out into lots, which are now offered for sale on reasonable terms as any ever offered by the various Homestead Associations in our city. The tract is known as the "University Mount Survey," and derives its name from the fact that the Directors of the University College have selected a site of about twenty acres in the centre of the tract for their College Building and Park. This property is more beautiful than any other ever offered in this market, and its location is such that it must in the natural progress of improvement soon be in great demand for places of residence. That this property will increase in value, is as certain as the future of San Francisco.

Investments in Real Estate, it is well known, have paid as largely as any other, and insurance against risk of depreciation in value is secured by the sure and rapid increase of our population.

Invest in Real Estate, and you will find it more profitable than investing in wild-cat mining stock, or loaning money that may be paid in depreciated currency. The prices for lots in the above tract will remain uniform until after the holidays—that is, without interest. The title to the land is perfect.

For further particulars apply to

HARVEY S. BROWN,  
No. 19 Naglee's Building.

Lithographic Maps can be seen and had at the above named office. no 13 6mo

## 50 lbs. MARINE AND

## Fire-Proof Paint,

MANUFACTURED BY THE PACIFIC METALLURGICAL Works in this city, for Hulls and Decks of Vessels, from ground Mineral Rock, containing Arsenic, Copper, Litharge and six other Minerals. When used on the Decks or Bottoms of Ships, it is equal to a coat of Stone, and quite equal to Copper, no worms will ever effect it, and cheaper than any other paint.

## DIRECTIONS:

For Decks of Ships, use two parts Mineral Paint, one part White Lead, mix with Linseed Oil.

For Bottoms of Vessels, use one part ground sulphur three parts Mineral Paint, mix with Coal Tar and apply it hot.

For sale by all Ship Chaudlers and Trademen, in boxes of 50 lbs. each, or by the Pacific Metallurgical Works.

## 25 POUNDS FIRE-PROOF PAINT.

When used on Roofs, Buildings, or Fences, it is equal to covering them with a coat of Stone, being equally Fire Proof, and costing less than any paint.

## DIRECTIONS:

HOUSE.—Mix three parts Mineral Paint with one part white lead, thin with Linseed oil: if a lighter color is wanted, mix less paint, more lead.

ROOF.—Five parts of Mineral Paint, one part white Lead; mix with Linseed oil. Put it thick on a tin Roof as one coat when properly applied will last three years.

S. C. BRADSHAW, Agt.,

G. T. FOUQUER, Superintendent.

WORKS, North Beach; Office, 318 California st., San Francisco.

## WRIGHT'S PICKS.

JOHN WRIGHT, of Sacramento, has established himself in San Francisco for the manufacture of every description of PICKS, of the best material, at reduced prices. PICK EYES of the best iron furnished in any quantity, at low rates. Orders from the country promptly attended to. N. B.—None genuine unless stamped with my name. JOHN WRIGHT, 511 Market street, Opposite Battery, San Francisco.

## REMOVAL.

OFFICE OF THE PACIFIC METALLURGICAL Office is removed to 318 California street. Having enlarged our Works at North Beach, we are now enabled to reduce from 10 to 15 tons of Silver or Gold rock per day.

Gold and Silver ore, and Sulphuret Assayers', or Silversmith's sweepings reduced or purchased.

COPPER ORES—Highest market rates advanced in cash, for shipments. S. C. BRADSHAW, Agent, 318 California street, near Sansome, up stairs.

**Volcanic Smelting Furnace.**

PERSONS DESIRING INFORMATION AS TO THE USE of a economical properties of this Furnace, and intending to make use of the same, when satisfied of its superiority over all other means of reducing ores and separating metals from the sulphurets, can obtain all needed explanation and advice in regard to the same, and the terms of sale of rights to use the same, on application Col J. D. Stevenson or T. Ogg Shaw, or by letter to the proprietress through the Post Office of San Francisco. Drawings may be seen at the office of Col. J. D. Stevenson, No. 614 Merchant street, or at the office of T. Ogg Shaw, in Brannan's Building, Montgomery street.  
The time required for reducing ores by this Furnace is from three to eight hours, and the amount of fuel only one-tenth as much as is consumed by other processes.  
The process of condensation is applied to this Furnace which will save all those portions of precious metals which usually escape in a valuable form.  
The attention of all interested in the subject is requested to examine the important results obtained by this process.  
Parties wishing will be allowed to erect a trial Furnace of a capacity for smelting one ton of ore or more, on signing an obligation to pay the usual fee for the right to use it, should they continue to make use of the invention or a longer period than two months.  
mch 16 MRS. E. J. HALL, M. D., Proprietress.

**New Style of Lady's Buckle.**

**W. BOHM, INVENTOR & PATENTEE**  
THE SUBSCRIBER HAVING OBTAINED LETTERS PATENT from Washington for an improvement in the construction of Ladies' Buckles, is now ready to furnish the same in every variety of style. This buckle possesses several very important improvements over any other in use.  
The invention having been carefully examined at the Patent Office, has been adjudged to be a useful improvement, and Letters Patent have been granted for 17 years. It excels all other buckles in  
- Usefulness, Strength and Appearance.  
The Public is respectfully invited to call and examine this Buckle at the Jewelry Establishment of  
BRAVERMAN & LEVY,  
621 Washington Street, San Francisco.  
JOSEPH BROTHERS,  
607 Montgomery Street, San Francisco.  
FLOBERG & CONRAD,  
118 I Street, Sacramento.  
Agents for the Patentee.  
Every Buckle sold will be guaranteed as to its Strength and Durability.  
W. BOHM, Patentee.

**REAL ESTATE PURCHASED AND SOLD, AND LOANS NEGOTIATED.**

**WHEELER'S**  
**Amalgamating and Separating Pans.**

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of triturating, and in cleaning up. By the introduction of the Separating Pan to follow the triturating this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

\* \* \* These Pans may be seen in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves.

NO. 22.

#### MRS. HALL'S SMELTING FURNACE.

We are led to believe from a brief paragraph in a late number of the *Virginia City Union*, that the experimental furnace which it was recently announced was in course of construction, after Mrs. Hall's patent, has proved a success. We have ever had much confidence in the invention and will not abandon the same until its failure shall be demonstrated by a fair trial on a practical, working scale. The principles combined in the construction of this furnace are evidently correct in a scientific point of view, and most unquestionably comprise many and important improvements over any other furnace ever constructed. The principal feature of the invention is an enlarged and practical application of the blow-pipe of the laboratory to the most extensive reduction works which it may be desirable to construct. Another important principle, and one which we believe to be entirely new, is the application of a cold water apparatus for condensing and precipitating any volatilized metals, which may be thrown upward by the intense heat and draft of the furnace. Those of our readers who are familiar with the discussions which grew out of the supposed loss of gold by volatilization at the Mint in this city, while that institution was under the direction of Col. Harazthy, must be aware that there is liability to much loss from this cause. At that time numerous ingenious expedients were resorted to to condense those fumes, but, apparently with very unsatisfactory results. Mrs. Hall has most unquestionably succeeded, perfectly, in accomplishing the object sought for, in this, by numerous ingenious metallurgists and mechanics at and present, and that to by an arrangement, so simple and cheap, that it is an especial wonder that no one should have thought of it before. A very correct description of the apparatus is given as follows, by a late correspondent of the *Evening Journal* of this city:—

It consists of a receiver, into which passes the flue of the furnace, and in which the flue terminates or is cut off, and then surmounted by a conical cap, like a draft-cap of an ordinary smoke pipe or chimney. From beneath this cap the fumes pass into the receiver, where they come in contact with a heavy shower of cold water from a sieve in the top, resembling the shower sieve over a bath tub. An opening in the centre of the sieve allows the draft to continue from the flue to the outer air. Thus all the fumes are subjected to condensation without any loss of heat in the furnace; indeed, the heat is rather increased by being confined and driven back by the cold water coming in upon the flue. When the water in the receiver reaches a certain height, it is carried off by a waste pipe, placed at a level below the outlet of the flue.

In addition to the series of blow-pipes, by which a large amount of oxygen is forced into the furnace, jets of steam are also, from time to time introduced, which greatly aid in the oxydization of the sulphurets. An important chemical secret, also involved in this invention, is described by the writer in the *Journal*, already quoted, as follows:—

"Carbon and sulphur both combine readily with every known substance; but their affinity with each other is closer than with any others. When placed in contact in proper proportions, if heat be applied, carbon rapidly absorbs and combines with sulphur in fumes, and they pass off together. When the sulphurets of the metals are heated on a charcoal support, the separation and absorption of the sulphur pro-

ceeds much faster than the oxidation of the metals, and consequently their reduction to a fluid state is secured in a period of time proportioned to the intensity and rapidity of the combustion. This is because both carbon and sulphur have a stronger affinity with oxygen than the metals have, and combine more readily with it.

It is plain, therefore, that in an intense heat produced by a strong blast of air upon charcoal, the facility of reduction of metals must be in direct ratio with the desulphurizing of the same by combination of the sulphur with the carbon and oxygen. This, it is claimed, is most thoroughly performed by the series of blow-pipes, jets of steam, and cold water showers, which form a part of the construction of the Volcanic Smelting Furnace.

We understand that an experimental furnace, capable of smelting one ton of ore at a time, is now in process of erection in this city, and will be ready for operation in a few days, so that those of our citizens who may be interested in the success of this promisingly important invention, will soon have an opportunity of seeing it put to a practical test. If it succeeds, it will be of vast utility to the recently developed copper interests of the State, and by its simplicity and economy, render available millions of tons of ore, which can be of little or no value in this state, under any other known system of reduction.

#### OUR MINING LIST.

We continue our Mining List to-day. During the week we have added fifty-four additional companies, making the present number, all told, *two hundred and three* Mining Companies, who have their principal offices of business in this city. Of this number 30 are in California (19 in the Slate Range District); 14 in the northern States of Mexico; 62 in Esmeralda and districts on the Eastern Slope to the south of that point; 84 in the region about Virginia City, and the balance, 13 in number, in the Humboldt region.

There are numerous other companies, incorporated as San Francisco companies, but we have confined our table to those only who have regularly established offices in this city. No doubt we have omitted many, in our search, and we should be happy to add all such to the list as fast as they are handed in. Many errors in our last week's list have been corrected, but doubtless others still exist which we shall correct as fast as they come to our knowledge. We have lists also in preparation for such as have their offices in Virginia City and Esmeralda, which will appear in due time. There are many important facts, statistical and otherwise, connected with these companies, which we shall speak of in future issues of the Press.

The salvors of treasure from the Golden Gate, have recovered between \$600,000 and \$700,000. They offer to compromise with all shippers at 50 per cent. Some houses have already settled at that rate.

MIRRORS OF THE WORLD.—The proprietors of Wolfstenberg's celebrated Panorama will exhibit the same at the Eureka Theatre, in this city, for "this week only," commencing this Evening. This is one of the finest of this class of paintings, which has ever been produced, and is well worth seeing.

#### MINING CORRESPONDENCE.

GRASS VALLEY, MARCH 25, 1863.

FRIEND EWER:—Our town, the scene of so many excitements in quartz, is again all alive with "copper." Every one is wild with the copper fever, prospecting being the order of the day. The cause of it being what certainly seems to be a genuine bona fide *Copper Mine*, on Rouse's Ranch, about two miles below the town. This ledge has been known to exist for some years, but having been tried for gold and failed, it gradually fell into discredit. Sometime during last November or December, Mr. John Armstrong, formerly a well known resident of this place, but who had made San Francisco his residence for some time, visited his old home, and quietly located the ledge as the *Excelsior Sulphuret Mine* and I suppose took specimens of the rock with him below, at any rate, a short time after he left here, Mr. E. Maslin (late District Atty. of this Co.) was seen to doff the Lawyer's stately suit of black, and put on the grey shirt and other toggery of "yr honest miner," and pitch into the "Sulphuret Mine" in decided earnest. It soon leaked out that copper had been discovered, and then the rush began, the country around about was staked off and claimed all over almost even

"Down to Earth's profound  
And up to Heaven."

And I will venture to say that to-day there is not a man in Grass Valley, who has not somewhere about his clothes a piece of rock that he firmly imagines contains copper. I see from the papers that a company has been formed and incorporated in your city, known as the *Nevada Copper Mining Co.*, and it is believed here that men of wealth and influence are connected with it. Certain it is that should this discovery prove what it gives every indication of being—a genuine Mine—it will add to the already abundant mineral wealth of our town, enough to make this "Valley of Grass" the banner town of the interior and, to those who quietly yet energetically have discovered and developed this new phase of our mineral life, will be due the thanks of our community. I will keep you posted—shall probably visit the mine, to-morrow. MINER.

CONCLUDED.—In to-day's issue we conclude the valuable and interesting treatise upon the working of silver ores, by James Napier, Esq. Mr. N., from a long residence as Chemist and Assayer at the Mexican Mint, in one of the the most extensive silver mining localities in that country, has abundantly prepared himself to write understandingly and fully with regard to the method and manner of working silver ores in that country, and the philosophy of the same. These numbers, to persons engaged in working silver ores, must prove most acceptable and valuable, while the general reader, will doubtless be pleased that the series is concluded, and more room afforded, in our columns, for other matters.

COPPER has been found at Queen Charlott's Island, near Victoria. Coal of a very superior quality has also been found within three miles of Port Angeles.

combine with mercury. If, for instance, metallic copper, in the form of precipitate, with a little salt as an exciting agent, be added to an ore containing sulphide of silver, metallic silver and sulphide of copper will be the result. This result will be more or less perfect, according to the conditions under which the experiment is made. If the ingredients be ground in a mortar, the result will be rapid; but if mercury be now put with this, it will form amalgam but very slowly indeed, unless heavy friction be used. On the other hand, native silver, and metallic silver, formed by precipitation from the sulphate by copper, or by many other means, will amalgamate with greater ease; so that the silver in Dr. Uslar's experiments might actually have been reduced to the metallic state, but would not amalgamate in the torta; and such probably was the case. I have repeated these very experiments of Dr. Uslar on a smaller scale; that is to say, I took the usual proportions of salt and sulphate of copper, and mixed with them moderately rich silver ore. After these had remained in contact for about twelve hours—part of the time exposed to a tropical sun—the experiment was divided into two portions; to one was added a small slip of very bright metallic copper, and to the other a piece of polished iron. Almost the moment the copper was added, it became coated with a white precipitate of silver; silver was also precipitated on the iron, but not until it had been in contact for some time. Again, if we take into consideration the small proportion of metallic silver there is in the torta, compared to the enormous amount of earthy matters present; and also the small amount of mercury, and that the two metals would have to be brought into actual contact before they could combine; it would, I think, have been rather strange had amalgam been formed. It is not enough that silver and mercury be brought in contact with each other to make them combine; but, in many cases, it requires heavy friction; and in a thick paste mass like a torta, the difficulties would be much increased. When the chloride of silver is in solution in common salt, then we have a chemical action going on by which we can better understand why amalgamation takes place.

The next argument used against the formation of chloride of silver is founded on the fact, that it had failed to be detected in tortas which had been left in the patio for months, without mercury I presume. The following experiments made by myself may entirely account for this:

The first experiment was on pure sulphide of silver. To this was added a small portion of bi-chloride of copper and salt, and the result was an abundant formation of chloride of silver.

The next experiment was made with common silver ore of moderate richness, which, besides sulphide of silver, contained also sulphides of iron. To this were added the usual quantities of sulphate of copper and salt, and the result was, that chloride of silver was formed after a few hours' standing; but, at the end of three days, I was surprised to find that the whole of the chloride of silver had again disappeared. The experiment was prolonged for three weeks, and tested daily for chloride of silver, thinking it might reappear; but it did not. This experiment was repeated at various times, and with different ores; and in every case chloride of silver was formed, but in some instances only did it disappear on standing. I may here observe that the chloride of silver held in solution at one time in a torta must necessarily be very small, from the fact that the quantity of salt used is only sufficient to hold a very small quantity in solution at once; so that in making such experiments as the above—unless the ores used be very rich, and a large excess of salt be added—one must not expect to obtain an abundant formation of chloride, but rest contented with finding a moderate proportion, as the process is one which goes on but very slowly indeed.

It became a question why the chloride of silver, when once formed, disappeared again? This I tried to discover by numerous experiments on a small scale. In tortas, where large quantities of sulphide of iron, particularly of the white variety, was present, the chloride of silver was decomposed, and chloride of iron formed; the silver being again probably converted into sulphide. [With artificial sulphide of iron, chloride of silver is very rapidly decomposed, particularly when heated.] Sulphides of copper had no action on chloride of silver. Where galena was present, the chloride of silver was very rapidly decomposed, and chloride of lead formed. Blende had a similar effect; and this may

explain why in *Zacatecas*, and some other districts where the ores contain blende, and sometimes small quantities of galena, they are obliged to use an excess of magistral for the purpose of first decomposing these sulphides. We are also aware that if sulphate of copper and salt be added to galena and blende, that chlorides of lead or zinc would be formed; and there are doubtless, many local actions taking place in tortas, which may vary very much with the nature of the ores operated upon. I have withheld many experiments made on a small scale on the subject; believing that it is only by close attention to the many various changes which take place in the tortas themselves, that a true knowledge of the theory of the patio amalgamation can be arrived at, and that laboratory experiments often only tend to lead us astray, unless corroborated by actual results on a large scale.

To prove further the formation of chloride of silver in the operation, I have obtained numerous samples of tortas in actual operation, after the salt and magistral had been added, but before the addition of the mercury. In every case did I find chloride of silver; and even when the mercury was present, in tortas far advanced, chloride of silver was always found. My general method of testing was to digest the sample for a short time in a solution of hot common salt; then filter, and add to the filtrate a clean piece of copper, upon which the silver was precipitated. In some cases the sample was digested in weak ammonia, filtered, and an acid added to the filtrate, which precipitated the chloride of silver.

From what has been said, it is very evident that, at the commencement of the amalgamation, there must be a considerable quantity of free chloride of copper present; because the whole of the ingredients necessary to carry on the operation to the end are added at once, and yet the torta does not become *hot*—provided of course the ingredients have not been added in excess. How is this? The only answer I can give is, that the patio amalgamation is founded on the affinity existing between sulphide of silver and chloride of copper, and that if the torta become *hot* at the commencement, when an excess of materials were not added, then we would have no such process as the patio.

When a torta is *very hot*, amalgamation does not go on nearly so rapidly as at other times. This may be owing to the mercury becoming covered with a coating of chloride, thus preventing the chloride of silver from being reduced.

Now, according to Mr. Bowring's theory, that the first action which takes place is the conversion of part of the mercury into chloride, the torta ought to become *hot* at the very commencement, whereas such is not the case; and to avoid loss of mercury in this way, Mr. Bowring proposes, and has patented, the use of protochloride of copper instead of magistral.

\*Mr. Louckner, whom I have before had occasion to mention in these pages, was a gentleman of the highest scientific attainments, and had studied closely, for upward of thirty years, every thing connected with the reduction of silver ores in Mexico. He had also written what, I have no hesitation in saying, would have been the most valuable treatise which has yet appeared on the subject, but which, I regret to state, is lost to the world. In 1855, Mr. Louckner was travelling from Angahuan to Guanajuato, having with him his MSS. At a certain part of the road he was attacked by robbers; and, on attempting to defend himself, his pistols missed fire. He was then overpowered, robbed, severely wounded, and left on the highway for dead. When he recovered himself, he found his papers and MSS. torn and scattered to the winds. Mr. Louckner died four and a half years afterward in Guanajuato.

LECTURE.—We had the pleasure of hearing Mr. LEIGH HARNETT's address before the Bible Temperance Society on Sunday week, on "The Power and Genius of America." The address was not only an able effort, but a very grateful and gratifying tribute to our Country, coming, as it did, from an educated Englishman. His sentiments he claims are but the sentiments of the great mass of his countrymen. If such be the case we may rest assured that the heart of England is with us in this hour of peril. The address occupied an hour in delivering, during which the speaker sustained himself with great ability, and showed himself thoroughly acquainted with the present condition and future destiny of America. Mr. H. is an unflinching Union man, and a firm believer in Manifest Destiny. Would to God there were more like him!

## Mining and Scientific Press.

The MINING AND SCIENTIFIC PRESS is published at the Exchange Building, Room 27, corner of Battery and Washington streets San Francisco, Cal., at FIFTY CENTS per month, or \$4 per annum, in advance.

C. W. M. SMITH and W. B. EWER, - - - - - Proprietors.

### Engravings, Electrotypes, etc.

We execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEROTYPING and ELECTROTYPING, Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing. Job Work executed with dispatch at low rates. PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

### To Printers.

AN INTEREST in one of the most flourishing and best paying Newspaper Offices in the mountains is offered for sale on easy terms. A rare opportunity is hereby presented to any printer desirous of establishing himself in a good business in one of the healthiest, most thriving and delightful mountain towns in the state. For further information enquire at this office.

SUBSCRIBE.—Are you a miner and not a subscriber to the MINING AND SCIENTIFIC PRESS? If so, you are an annual loser of many times the price of a year's subscription, particularly if you are engaged in quartz mining. The same amount of practical information, important to miners and mechanics, which is contained in a volume of the PRESS, cannot be bought from the shelves of any bookstore in the country for the price of several year's subscription. Do you ever send a paper to the "Old Folks at Home?" If so, and you desire to send important information and valuable reading matter, you can find no paper that will be read with so much eagerness by them, or one that will convey to them so full an account of the real industry of the country as the MINING AND SCIENTIFIC PRESS. We invite all to send us their names and *four dollars*, or *two dollars* for six months, and become patrons of the only mining paper printed on the Pacific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examination, and with the hope that it may so far meet with their approval as to warrant their subscribing for it at once. It is not our usual custom to receive a subscriber for less than six months; but inasmuch as we are anxious to introduce the paper where it is not now known, we will, for the present, send the PRESS for three months even, on the receipt of one dollar, in coin or stamps. It is our belief that no one will wish to discontinue the paper after being a constant reader of it for even that short period.

### SUGGESTIONS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in this country, is worth equally as much in England and some other foreign countries. Four patents—American, English, French and Belgian—will secure an inventor exclusive monopoly to his discovery among one hundred millions of the most intelligent people in the world.

The facilities of business and steam communication are such, that patents can be obtained abroad almost as easy as at home. The majority of all patents taken out by Americans in foreign countries are obtained through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. Having established agencies at all the principal European seats of Government, we obtain patents in Great Britain, France, Belgium, Prussia, Austria, Spain, etc., with promptness and dispatch.

Models are not required in any European country, but the utmost care and experience is necessary in the preparation of the specifications and drawings.

When parties intend to take out foreign patents, engravings should not be published until the foreign application has been made.

CAUTION.—It has become a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. We caution the latter against heeding such applications as they may otherwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrust their cases to the care of a competent, reliable agent at home.

While it is true of Most European countries that the system of examination is not so rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitor in order that they may stand the test of a searching legal examination; as it is a common practice when a patentee finds a purchaser for his invention, for the latter to cause such examination to be made before he will accept the title.

It is also very unsafe to intrust a valuable invention to any other than a solicitor of known integrity and ability. Inventors should beware of speculators, whether in the guise of patent agents or patent brokers, as they cannot ordinarily be trusted with valuable inventions.

## SAN FRANCISCO MINING NOTICES.

## ASSESSMENTS LEVIED.

Assessments upon Mining Stocks have been levied as follows:—

Garabaldi.—Assessment of \$1 per share, levied March 2nd.

Sutro.—Assessment of \$1 per share, levied Feb. 23, payable March 23.

Silver Quartz Mill Co.—Assessment of 5 per cent. levied Feb. 23, payable March 28.

Helvetia.—Assessment of 25 cts. per share, levied Feb. 17, payable March 10.

Zouave.—Assessment of \$1 levied Feb. 22, payable Mar. 21.

Rogers.—Assessment of \$5 per share levied Feb. 4, payable Mar. 15.

Sam Wright.—Assessment of 50 cts. per share levied Mar. 2, payable immediately, delinquents to be sold Apr. 2.

Napoleon (copper).—Assessments of \$3 per share levied Mar. 3, payable in 30 days.

Golden Age.—Assessment of one dollar per share levied Feb. 24, payable March 26.

Washoe Gold & Silver.—An assessment of 2 per cent. on capital stock was levied Feb. 16, payable Apr. 1.

Rhodes' Diggings.—Assessment of 25 cts. per share levied Feb. 26, payable Mar. 5.

Texas Co., at a Meeting held Feb. 14, levied an assessment of one dollar per share, payable to the Secretary in Virginia City.

Santa Rosa Co.—February assessment of 20 cents per share now due and payable.

Madison Co.—An assessment, two dollars per share, was levied Feb. 17, payable immediately, at Office, 600 Merchant St.

Union Co.—An assessment of one dollar per share was levied February 16, payable on or before March 25.

Pena Co.—An assessment of \$3 per share was levied Feb. 5, one half payable March 1, balance April 15.

Kossuth Co., Devil's Gate District.—An assessment of 10 cts. per share was levied Feb. 7.

Constitution Company levied an assessment of 25 cts. per Feb. 11, payable immediately.

La Plata Oro Co. levied an assessment of five dollars per share, Feb. 9, payable at Office of the Secretary in Virginia City.

La Plata Co. levied an assessment of 50 cts. per share Feb. 2nd, payable at Office of the President.

Alamo Co. levied an assessment of 50 cts. per share, Feb. 11, payable on or before March 20, at 115 Cal. Street San Francisco, or at office in Carson City.

Tucker Co. levied an assessment of 25 cts. per share, Feb. 11, payable immediately at 608 Merchant St.

Hawley Co. levied an assessment of one dollar per share, on Feb. 9, payable on or before March 12, to Superintendent at the mine, or Secretary at Office.

Slate Range Co. levied an assessment of 50 cts. per share, Feb. 4, payable, March 15.

Moss G. & S. M. Co.—An assessment of 50 cents per share was levied Jan. 27, payable at 428, Montgomery St., or to the Superintendent at the mine.

White Cloud G. & S. M. Co. levied an assessment of 75 cents per share, Jan. 27, payable to the Secretary, at 428, Montgomery St.

El Dorado G. & S. M. Co.—An assessment of One Dollar per share was levied Jan. 23, payable to the Sec. or to the Supt.

Gaudaloupe S. M. Co.—An assessment of \$30 per share was levied, payable on or before March 1st.

El Tesora Mining Co.—An assessment of \$1½ was levied Jan. 27, payable at office on or before Feb. 27.

Polar Star G. & S. M. Co. levied an assessment of 50 cents per share, February 4th, payable on or before the 4th of March, at the Office in this city or to the Superintendent at the mine in Aurora, (Esmeralda.)

Dios Padre G. & S. M. Co. levied an assessment of 3 dollars per share, Jan. 31, payable in 30 days, also an assessment of 2 dollars per share, payable in 60 days, at office 502 Montgomery street.

Beckwith G. & S. Mining Co.—An assessment of 25 cents per share was levied Jan. 24, payable immediately.

Sonora Mining Co.—An assessment of 25 cents per share was levied, Jan 23, payable immediately.

Overman Mining Co.—25 cents per foot, Jan. 29, payable within ten days.

Chs. Caney Mining Co.—50 cents per share, Jan. 21, payable on or before Feb. 20th.

Sierra S. M. Co. An Assessment of \$2½ was levied Jan. 22—payable immediately, at Office 575 Mission St.

Mount David-on Co.—An Assessment of 50 cents per Share was levied, Jan. 23, payable on or before March 1st, at Office 47 Montgomery Block.

Airatic.—Fifty cents per share, payable at No. 4 Armory Hall, San Francisco, or to the Superintendent at the Mine.

Hattie G. & S. M. Co.—Thirty cents per share, levied Jan. 31, payable at Office in San Francisco, or at the Mine.

Hale & Norecross.—Assessment of Ten Dollars per Share, levied Jan. 31—payable at the Office in this city, or to John Skae, at the Mine, on or before Feb. 25.

Mina Prieta S. M. Co.—An Assessment of Five Dollars per Share was levied, Jan. 31, payable on or before March 5th—at Office, cor. Montgomery & Jackson Sts.

Recorder Mining Co.—An Assessment of One Dollar per foot was levied Jan. 19, payable half on or before Feb. 18, and balance on or before March 20.

Hale & Norecross S. M. Co. have levied an assessment of \$5 per share payable on or before Jan. 26th.

Martin White.—An assessment of 20 cts. a share was levied, Jan. 2.

Oriental G. & S. M. Co.—An assessment of 50 cts. per share was levied, Jan. 14, payable at Office, cor. Sutton Avenue and C St., Virginia City.

Baltimore America Consolidated.—An assessment of 50 cents per share was levied, Jan. 5.

Savage.—An assessment of \$35 cents per share was levied, Jan. 7.

Hawley.—An assessment of \$1.00 per share was levied Feb. 9, payable March 12.

Cole S. M. Co.—An assessment of One Dollar per share was levied, Jan. 10, payable, Feb. 1.

United States M. Co.—An assessment of six and two-thirds cts. per share was levied Jan. 10, 1863, payable to the Superintendent at the mine, or to the Secretary, Rooms 7 and 8, Government House, San Francisco.

Sierra Nevada S. M. Co. levied an assessment of \$15 per share, Jan. 15—payable Feb. 18.

Lady Bryan.—An assessment of 70 cts. was levied, Jan. 13, payable on or before Feb. 16.

Ida G. & S. Co. (Russ District)—An assessment of \$1 was levied, Jan. 14.

## ASSESSMENT SALES.

Sales of Stock for non-payment of assessments are advertised to be sold as follows:—

Oriental Tunnel Co. will sell, on Saturday, Mar. 28.

Mars will institute proceedings against delinquents, Mar. 16th.

Planet will institute proceedings against delinquents Mar. 16th.

Moray Co. (V. City.—Suits for delinquent assessments will be commenced, March 14.

Michigan Co. (Gold Hill) will commence suits for delinquent assessments, March 16.

Lady Bryan G. & S. M. Co.—Shares of delinquent stockholders will be sold at auction for assessments, at No. 400, Montgomery street, on Jan. 27.

## GENERAL NOTICES.

Yellow Jacket.—Corporate Deed now ready for signature at office of H. G. Maynard, Gold Hill, N. T.

Jenny Lind (Esmeralda).—Owners of ground in this Cot are requestes to call and sign deed of trust at 608 Merchants St.

Mount Hope Co.—Persons claiming stock are requested to present title papers for examination till March 16.

U. S. Mining Co.—All persons claiming stock are requested to present title papers for examination at Nos. 7 & 8 Government House.

Caution.—D. M. Tyrell warns persons against purchasing a certain 10 feet of ground in the Wellington Co., standing in the name of J. B. Magee—also 20 feet, standing in name of W. Williams. (See Territorial Enterprise.)

Ashland Co.—L. A. Gould, in the name of the Moss Co. notifies the Ashland Co. that their westerly drift has cut the Lamb ledge, in the Moss Co.'s ground, from which the Ashland Co. is forbidden to extract any valuable metals.

Coso Silver Mining Co.—The Office of this Company has been removed from the Stevenson House to Nos. 11 and 13 Court Block, No. 636 Clay street between Montgomery and Kearny. Entrance on both Clay and Merchant streets.

THE SWEETZ [Co., Gold Hill, give notice that Baltic

Company have wrongfully claimed and worked their ground since July, 1860.

THE CHIMNEY ROCK Co., lying next west of the Virginia Co. claims have notified the Hazel Green, Tingley and Bach & Paxton Companies that they are trespassing upon the Chimney Rock Co's ground.

## MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

THIRD YEAR! VOLUME VI.—NEW SERIES!

A new volume of this extensively circulated paper commenced Sept. 11, 1862. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

*The Mining Interest!*

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

*The Inventor!*

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

*The Mechanic and Manufacturer!*

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

*To Chemists, Architects, Millwrights and Farmers!*

This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

## Terms.

To mail subscribers:—Four Dollars per annum.

## Club Rates.

Five Copies for Six Months, \$6.  
Ten Copies for Six Months, \$16.  
Ten Copies for Twelve Months, \$30.  
Fifteen Copies for Twelve Months, \$44.  
Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 80 Names can be sent in at different times and from different Post-offices Specimen copies will be sent gratis to any part of the country.

## EWER &amp; SMITH, Publishers,

The Great Success of this Century, as an Aid to Practical Medicine.

The Mysterious Problem of Material Nature, Electricity Made Subservient for the Cure of all Nervous and Spinal Diseases

THAT THIS PRINCIPLE, successfully applied to diseased states of the system, is to prove the great sought-for necessity, long wanting by physicians to aid their medicines in overcoming organic and functional derangements of the human body. It is a part of the great principle of vitality known as nervous influence and necessarily must have much to do in obviating diseased action.

## Too Much Cannot Be Said

In its praise; for it is highly probable that in health there is an exact equilibrium of the ELECTRIC principle; and should this secret and hidden equipoise of health be broken or lowered—should the body be negatively electrified when it should be positively charged—is not the current broken, and is there not a war of forces going on in our system? This needs correcting and in order that the tissues of the body should be susceptible to remedial agents we must first restore and

## Awaken the Magnetic Life Within Us.

The spinal and sympathetic nerve systems. Believing as I do most firmly in this great magnetic or electrical intensity of the earth, with its influence upon our bodies in health and disease, I am led to take advantage of the press, through which to awaken attention to the subject, that good may come to all.

[FROM THE LONDON "MINING AND SMELTING MAGAZINE."]  
THE MEXICAN METHOD OF AMALGAMATION.

BY JAMES NAPIER, JUN., F. C. S.  
Late Chemist and Assayer to the Guanaxuato Mint, Mexico.

CONCLUDED.

THEORY OF THE PROCESS.

HAVING now given a brief sketch of the mode in which the Mexican amalgamation is carried out, I shall pass on to consider what chemical action takes place in this most interesting process. Before doing so, however, let us consider for a moment two terms—*heat* and *cold*, used in these papers.

*Heat and Cold.*—There are two kinds of heat: one is caused by there being added a superabundance of magistral; the other is induced by cold, and is called "*calor de frio*." These differ only in cause, the result in both cases being the destruction of mercury. If a *hot* torta be heated by artificial heat, the chloride of mercury will act on the sulphide of silver in the same manner as the chloride of copper, forming chloride of silver and sulphide of mercury.

On cold mornings the tentaduras, or samples, often show signs of heat, in which case the action is called *calor de frio*—heat from cold; but, as the day advances, and the sun begins to act on the torta, the effect passes off. In the winter season, a somewhat less quantity of magistral is necessary for carrying on the operation than in the summer months: the amalgamators begin to decrease the quantities of magistral about the beginning of September.

When a torta becomes hot from the use of a superabundance of material, a quantity of wood ashes or lime is added for the purpose of decomposing the excess of bi-chloride of copper to protochloride.

The term *cold* simply implies that the operation is not going on so fast as it ought, and that a sufficient quantity of magistral has not been added; if the torta be allowed to remain long in this state, a large quantity of mercury is apt to be lost in the form of oxide.

*Theories of the process.*—According to Sonneschmidt, the only theory which the Amalgamators had before his was, that the salt cleaned the silver, the magistral heated it, and that both reduced it to the metallic state so as to combine with the mercury. They were also aware that, for each ounce of silver produced there must be lost an equal weight of mercury; but *why* this should be so, was a problem they could not solve, and all mercury lost beyond this they considered mechanical.

*Sonneschmidt's Theory.*—Sonneschmidt after many years of practice and careful experiment, published a most valuable treatise on the various methods practised in Mexico for the reduction of silver ores, and lays down for the patio amalgamation his theory, which may be briefly stated as follows:—

The ingredients added to a torta, are salt, magistral (sulphate of copper,) mercury, and sulphide of silver. The salt and magistral act on each other, and form a bi-chloride of copper and sulphate of soda; the bi-chloride of copper next acts on the sulphide of silver, forming chloride of silver, which is dissolved in the excess of salt added; and the silver is next reduced to the metallic state by the mercury forming calomel and amalgam. This was Sonneschmidt's theory, which to the present day is almost universally received as the true one. However, since his time it has been further shown, that the proto-chloride of copper, formed by the action of the sulphide of silver on the bi-chloride, is dissolved in the excess of common salt, and acts on another portion of the sulphide of silver, reducing it to the state of chloride to be acted on by the mercury, and be converted into amalgam. It has also been shown very satisfactorily by Rossingault, who has devoted some time to the subject, that the copper of the sulphate is ultimately converted into a sulphide by the following equation:—

Sulphide of mercury is also at times found in tortas, and it has been supposed that this is formed by the calomel acting on the sulphide of mercury; but may it not be formed, as in the arrastres, by the direct action of the mercury on the sulphide of silver? Some amalgamators suppose that the copper is ultimately converted into oxychloride.

*Bowring's Theory.*—In 1848, Mr. John Bowring, who has

had much practice in the patio amalgamation, as carried on in Mexico and Peru, read a paper before the British Association, in which he denied that chloride of silver was formed at all in the process. His principal reason was founded upon experiments made in *Guadalupe-y-Calvo*, in Mexico, where he states, chloride of silver could not be found even after leaving the tortas in the patio in working order for the space of four months. In 1858, Mr. Bowring also published a pamphlet in Mexico defending the same idea; and describing, as he likewise did in the paper mentioned, a new theory, the basis of which I translate from his pamphlet:—  
"It is," he writes, "well known, that the materials which are employed in the reduction of the sulphides of silver, consist of salt, sulphate of copper, and mercury; and that, by employing only two of these ingredients, nothing will take place. I mixed the three in an appropriate vessel, and found that the mercury combined with half of the chlorine contained in the bi-chloride of copper, and thus formed a proto-chloride of both metals. This combination of the latter metal—copper—has the property of absorbing oxygen; hence, we may suppose, that this element is the principal agent in the operation. I made some proto chloride of copper, tried it in the patio, and obtained a good result.

"According to the theory which this mode of treatment establishes, the bi-chloride of copper gives an atom of its chlorine to the mercury, and both metals are converted into proto-chlorides; the chloride of copper absorbs oxygen, which combines with the sulphur of the silver, forming sulphuric acid, and leaves the silver in a metallic state to amalgamate.

"The sulphuric acid formed by the sulphur of the silver and the oxygen of the proto-chloride of copper, decomposes the common salt, and the chlorine disengaged in this way combine in either of the two following methods:—1st. With the protochloride to form again a bi-chloride. 2nd. With the chloride of the protoxide of copper, which, absorbing another equivalent of oxygen, passes to the state of oxy-chloride, or chloride of the peroxide. According to my mode of thinking, the protochloride of copper produces in the beneficio (amalgamation) an effect analogous to nitrous acid in the manufacture of sulphuric acid. It is easy to imagine that the protochloride of copper, after it has absorbed oxygen from the air and water, and given it up to the sulphur, will return to repeat the same operation."

Mr. Bowring then gives the following proofs of his theory:—

"I. Dissolve, in a glass or porcelain vessel, salt and a small quantity of sulphate of copper, with this mix some mercury, and at the end of a few hours there will result a white powder which is protochloride of mercury: filter the solution, and precipitate the copper with caustic soda or potash. The orange colour indicates a salt of the protoxide; and if care be taken to gather on a filter the white powder, it will, in contact with caustic soda and ammonia, be converted into the protoxide of mercury, which may be known from the black colour it assumes. If the solution of proto-chloride of copper be left exposed to the air for a longer time, there will form on the surface a yellowish green crust, which is a chloride of the protoxide of copper.

"II. Beneficiate (amalgamate) a small quantity of ore, containing sulphide of silver, with salt, and bi-chloride of copper chemically pure; at the conclusion of the operation add distilled water; filter, and precipitate the solution with nitrate of baryta; when it will be found, that there has been a formation of sulphuric acid equivalent to the sulphur which was combined with the silver. It is to be noted that this sulphuric acid could not have been formed without the presence of oxygen, which, without doubt, resulted from the absorption of this gas by the proto-chloride of copper.

"III. Amalgamate silver ore with bichromate of potash and sulphuric acid (it is known that the chemical action of these two latter on each other is to evolve oxygen,) and it will be found that there is formed an amalgam of silver. In the same way, any materials which produce oxygen may serve in the amalgamation.

"IV. Take the amalgam of a tentadura (sample) of a torta which is in good working order, that is in such a condition that when the amalgam is pressed with the finger it gives out a white powder; dissolve this in pure nitric acid, and afterwards with distilled water, when it will be found that the white powder which remains is a protochloride of mercury." Again, in the same pamphlet, Mr. Bowring

states: "The difficulty there is in working ores containing chloride of silver (like those from the district of *Catoro*) demonstrates clearly the nonfoundation of the formation of chloride of silver in the common patio amalgamation. Thus, we have Mr. Bowring's reason for rejecting the theory of Sonneschmidt, and denying that chloride of silver is formed, and also the theory of his own which he proposes to substitute.

*Uslar's Experiments.*—In 1853, Dr. Uslar published a pamphlet in Mexico, comparing the patio with the bath amalgamation, in which he, like Mr. Bowring, denies that chloride of silver is formed in the patio. He argues, that if the silver were converted into chloride, some other metal, such as copper, might be substituted for the mercury until the whole of the silver was reduced to the metallic state, and he instituted experiments to prove that such would not answer. Thus he introduced into a torta a superabundance of materials—salt and sulphate of copper, and some metallic copper. The result obtained was, no silver reduced, and the conversion of the greater part of the metallic copper into chloride. The next experiments were made with a view of protecting the mercury by copper or iron. The results were:—where iron was used, there was no amalgamation at all, the mercury coming out as it went in, without amalgam; but, where copper was present, the result was different, the amalgam containing a large quantity of copper with but little silver. The conclusion drawn by Dr. Uslar from the above experiments was, that the persistence of other metals is against the amalgamation.

In a third series of experiments, there was put into the torta double the usual quantity of salt; in two days afterwards the magistral was added, and the whole trodden at intervals during fifteen days. Then iron was added, and the mass again trodden; and two days after this the mercury was added; but the torta showed no symptoms of entering into amalgamation, and after remaining eight days longer in the patio, and being trodden daily, the mercury was taken out as it was put in, without amalgam. Hence, Dr. Uslar comes to the conclusion that it is not true that chloride of silver is formed by the salt and sulphate of copper, and reduced by the mercury; because, with the extra quantity of materials, chloride of silver ought to have been formed, the iron ought to have reduced it more rapidly than the mercury, and amalgam ought to have been formed; but nothing of the kind took place. He also argues, that as ores, containing native chloride of silver, cannot be worked by the patio amalgamation, it therefore cannot be formed by it. However, Dr. Uslar, unlike Mr. Bowring, proposes no new theory.

*Consideration of the Theories.*—Having now stated the various opinions generally entertained regarding the theory of this process, I shall venture a few remarks which may not prove altogether uninteresting, and may help to throw some further light on the subject. An apparently very strong argument used by Bowring and Uslar against chloride of silver being formed in the patio amalgamation is, that native chloride of silver, according to them, cannot be worked by that process. This might even be quite true, and yet chloride of silver be formed in the process; for we have only to consider the physical properties of the native chloride, to take a different view of the matter. It is a very hard horny substance, which, even in ammonia—probably its best solvent—will take some time to dissolve. Now, if a torta, the solution of salt is comparatively weak; it is also cold, and will dissolve but a very small portion of the newly-formed chloride; but of native chloride (or horn silver,) I question much whether the usual strength of the salt in a torta would be strong enough to dissolve any. Mr. Edward Lou-kner\* has often assured me that horn silver can be reduced very well, in fact, better than any other compound, in the patio, providing that great care be taken in the grinding, so as to have it in the smallest possible state of division, and that an excess of salt be added in the operation.

Another argument used by Dr. Uslar, to prove that chloride of silver is not formed in a torta is, that if such were the case, it ought to be precipitated or reduced by another metal, such as copper, or iron, previous to adding the mercury.

Now, metallic silver can be produced from the sulphide by various methods; but there is a great difference in the ease with which silver produced by such different methods will

**ANOTHER DIVIDEND-PAYING MINING COMPANY.**—The Imperial Silver Mining Company have just declared a first monthly dividend of 1½ per cent. on \$1,000,000, the amount of capital stock issued. This company was recently incorporated in this city, and consists of a number of mines and mills at and near Gold Hill, N. T., the various parties representing which have united their interests. Among the consolidated concerns is the Washoe Gold and Silver Company No. 1, well known in this city as the pioneer company in the mill enterprise of Nevada Territory.

**LADY BRYAN.**—This stock has been more largely dealt in in this city, the past week than any other in the market. It commenced at \$7 and has been gradually advancing until to-day it has reached \$25, with a still upward tendency. The cause of this movement is attributable to a rich strike at the mine, disclosing rock strongly resembling the Ophir. A quantity of this rock has been received in the city, and may be seen at No. 40, Montgomery Block. Some sanguine holders are looking for very high figures at an early day.

### WASHOE STOCK REMARKS.

[COMPILED FROM THE DAILY TERRITORIAL ENTERPRISE.]

#### MONDAY EVENING, March 16, 1883.

The stock market has been quiet to-day, owing, doubtless, to some extent, to the employment of a majority of the brokers in the formation of a new Stock and Exchange Board. The Board is now organized, and will be ready for action at an early day. There has not been much enquiry for stocks to-day. Potosi is in request at an advance, \$190 and 200 having been offered. The cause has not been publicly transpired. Birdsall is held firmly at \$40, with little disposition to sell. The location is regarded with favor. El Dorado is held firmly for advanced figures. There is considerable activity in Gold Hill stocks, particularly in the way of law suits. The Belcher is in trouble, the Leon and Sinaloa having brought suit against that company, while the latter is reaching for the new ledge struck by the Bay State. Of course the effect will be to reduce the prices of all the claims in dispute. Three suits upon a claim at one time are a heavy burden to carry. The following sales are reported by Platt & Low, of Gold Hill. Dunn at 7, 50.

#### TUESDAY EVENING, March 17th, 1883.

A deal of mystery has characterized the operations of brokers to-day. Much whispering has been observed—much significant counselling on the corners. Yesterday there was inquiry for Potosi at \$200 to 225. Operators stared and wondered what had created the demand. A startling development in the mine was the accepted explanation, but to-day brokers know better. The character of the forthcoming decision in the Chollar-Potosi has leaked out, and rumor now confidently asserts that the Potosi is largely gainer by it on the ground. Hence, Potosi is up, and \$350 is not regarded as an extravagant price for it. Shamrock has been selling for \$7 at 12, and probably 250 feet changed hands. Grass Valley has been saleable at an advance. It may be quoted at \$12 15. Pride of Washoe is looking up, 60 feet having changed hands to-day at \$25 @ 30. Bullion and Birdsall are saleable at our last quotations; 25 feet of Birdsall sold at \$37 50. The

following sales are reported by Platt & Low, of Gold Hill: Thirty feet Pride of Washoe at \$18; 10 feet Dunn at \$7; 20 feet Pride of the West at \$70, 20 feet Overman at \$35.

#### WEDNESDAY EVENING, March 18th.

There has been considerable life in the stock market to-day, and the number of transfers has been comparatively large. Potosi is still on the advance. It cannot be quoted at less than \$400, and but little is obtainable at these figures. The Shamrock has been in light request in advance on our quotations of yesterday. We understand that very fair looking rock is being taken from the mine. Zouave may be quoted at \$21 @ 22 50. As a majority of this stock is held at the Bay, a further advance is looked for. Bullion is again in request, and is marketable at \$40 @ 45. The Princess, at Gold Hill, is in demand at \$40 @ 50, and the inquiry for it at these figures is exceedingly lively. This claim adjoins the Union on the north and is likewise in litigation for the ledge claimed by the Yellow Jacket. There are but 600 feet in the claim. The following sales are reported by Platt & Low, of Gold Hill: 22 feet Overman at \$30; 20 feet ditto at \$36; 10 feet Dunn at \$8.

#### THURSDAY EVENING, March 19th.

The market has not been remarkably lively to-day, nor the transfers of especial moment. Potosi has fluctuated greatly, owing to the unexpected decision, or forthcoming decision, of the Supreme Court. From \$476 it receded to 200, but will probably revive somewhat before many days, or as the character of the decision is understood. Very fine specimens of ore from the Santa Rita are being exhibited, and the stock has advanced to \$50, at which figures 22 feet sold to-day. El Dorado is upward in the market, and has found buyers to-day at \$75. Birdsall is in request at \$45 @ 50, with more buyers than sellers. Pride of Washoe is marketable at \$25 @ 40, with considerable inquiry. Fifty feet changed hands to-day on private terms. Bloomingdale is again marketable at low figures. The company was incorporated to-day. Harrison, incorporated stock, may be quoted at \$25 @ 35. 10 Feet sold at \$30. Hazel Green can be sold at \$4 @ 5, Zouave at \$22, Osceola at \$15, Moray at \$30. Bullion is saleable at \$45, Eureka at \$30, Princess and Union at \$45 @ 50, Bay State at \$100, Buchanan at \$100, Dunn at \$7 @ 8, and Leon at \$20.

#### FRIDAY EVENING, March 20th

The day has been disagreeably stormy; yet the stock market has been comparatively lively. Potosi has not receded to the prices anticipated yesterday. Operators in San Francisco are not disposed to go into much of a panic on mere rumor. They are awaiting the decision. Telegrams announce that it is still held at \$425 @ 450. Fairview is advancing, and is saleable at \$36. Thirty feet sold to-day at these figures. Bullion is in request at \$40, and is marketable at 45. Fifty feet sold at \$40, and thirty at \$75. The Princess, at Gold Hill, is in demand at \$40 @ 50, and might be sold, probably, if in market, at \$50. The Bloomingdale has been in request to-day at \$5 @ 7. Sixty feet sold at an average of \$6. The El Dorado is held firmly at \$75 @ 80, with little in market. Ten feet sold to-day at \$75. Beach & Paxton is marketable at an advance on our last quotations, and cannot be quoted at less than \$325 @ 330. Five feet sold to-day at \$25. Birdsall is quoted at \$40, at which figures 18 feet sold to-day. Eureka, Gold Hill, is saleable at \$30 @ 35, with little in market. Zouave is quoted at \$21 @ 22, with a fair demand. The Insurance, west of the Beach & Paxton, is saleable at \$5 @ 6. Shamrock is rather on the decline. We quote it at \$15 @ 20. The following sales are reported by Platt & Low, of Gold Hill: 6 feet Gold Hill G. & S. M. Co. No. 1, (now called the Alpha), at \$400 per foot. 6 feet Gold Hill G. & S. M. Co. No. 2, at \$50 per foot. 20 feet Overman, at \$30; 10 feet Overman at \$35.

#### SATURDAY EVENING, March 24, 1883.

The business of this day has been rather light, although a number of heavy transactions are reported. Fairview has been in high request. 100 feet sold at \$40, and \$50 is now offered. Bloomingdale has been dealt in largely to-day. About 200 feet have changed hands at from \$4 to 7. The company is about penetrating its ledge at a depth of about 250 feet from the surface. \$10 is freely offered without takers. The Pride of Washoe is marketable at \$30; 32 feet sold to-day at that figure. Ashland is again meeting with request and may be quoted at \$10 to 12, with an upward tendency. The Santa Rita is advancing and is now held at \$35 to 60. Very fine ore is being exhibited from the mine. It is extremely gratifying to observe such evidences of value in the ledges back of Virginia. The Branch Mint at Gold Hill, is attracting some attention. Fine indications are developed a few feet below the surface. The Belcher is still advancing. It cannot be quoted at less than \$100 @ 125. The Princess, in litigation with the Yellow Jacket, is sought for at \$45 @ 50; 17 feet sold at \$50. Bullion is saleable at \$40 @ 45; 35 feet sold at 42 50.

## LOWER CALIFORNIA

## Colonization and Mining Company.

THE AGENTS SENT TO MEXICO BY the above Company having returned per steamer (ago) after having secured a tract of upwards of

**125,000 Acres**  
OF RICH AGRICULTURAL LAND,

and a valuable silver Mine,

the Company is now prepared to furnish exact information to Colonists who have already engaged, or those about to engage in this

## SPLENDID ENTERPRISE.

It proposes to send a vessel about the first of March, and there being but a limited number of shares NO TIME SHOULD BE LOST BY COLONISTS.

Farmers Miners and Mechanics,

with families are particularly invited by the authorities of the Territory. The land selected, in point of fertility of soil, is not excelled on the Continent. The climate is unsurpassed in the world. The richest Silver mines known to exist in the Territory are in the immediate vicinity and bordering on the agricultural lands of the Colony.

N. B. Bear in mind that a share costs, at present, only \$200, which entitles the holder to free transportation for self, family, and articles of personal use and an equal share in the land, the Company's Silver Mine, etc. A whole enterprise, being for the mutual benefit of all members only.

Full information can be had, and Mineral and Cotton specimens seen, by applying at the Office of the Company, North-west corner of Clay and Front Street.

## BOARD OF TRUSTEES.

SAN FRANCISCO.

## Attention! Attention!

A TRACT OF LAND, EMBRACING AN AREA OF 400 Acres has recently been surveyed and plotted out into lots, which are now offered for sale on reasonable terms as any ever offered by the various Homestead Associations in our city. The tract is known as the "University Mound Survey," and derives its name from the fact that the Directors of the University College have selected a site of about twenty acres in the centre of the tract for their College Building and Park. This property is more beautiful than any other ever offered in this market, and its location is such that it must in the natural progress of improvement soon be in great demand for places of residence. That this property will increase in value, is as certain as the future of San Francisco.

Investments in Real Estate, it is well known, have paid as largely as any other, and insurance against risk of depreciation in value is secured by the sure and rapid increase of our population.

Invest in Real Estate, and you will find it more profitable than investing in wild-cat mining stock, or loaning money that may be paid in depreciated currency. The prices for lots in the above tract will remain uniform until after the holidays—that is, without interest. The title to the land is perfect.

For further particulars apply to

HARVEY S. BROWN,

No. 19 Naglee's Building.

Lithographic Maps can be seen and had at the above named office, no 13 6mo

## READ THIS!

COAL OIL EXPLOSION.—ON SATURDAY EVENING, while Mr. Brewster was engaged in the Summer Street House in pouring coal oil from one can to another, his wife imprudently approached with a lighted candle and the oil exploded. Mrs. Brewster's arms were badly burned, as were also the husband's hands. However, he succeeded in mastering the flames, and preventing worse consequences. [Evening Bulletin, Aug. 4.]

## 50 lbs. MARINE AND

## Fire-Proof Paint,

MANUFACTURED BY THE PACIFIC METALLURGICAL Works in this city, for Hulls and Decks of Vessels, from ground Mineral Rock contains Arsenic, Copper, Litharge and six other Minerals. When used on the Decks or Bottoms of Ships, it is equal to a coat of Stone, and quite equal to Copper, no worms will ever effect it, and cheaper than any other paint.

## DIRECTIONS:

For Decks of Ships, use two parts Mineral Paint, one part White Lead, mix with Linseed Oil.  
For Bottoms of Vessels, use one part ground sulphur three parts Mineral Paint, mix with Coal Tar and apply it hot.

For sale by all Ship Chandelers and Tradesmen, in boxes of 50 lbs. each, or by the Pacific Metallurgical Works.

## 35 POUNDS FIRE-PROOF PAINT.

When used on Roofs, Buildings, or Fences, it is equal to covering them with a coat of Stone, being perfectly Fire Proof, and costing less than any paint.

## DIRECTIONS:

HOUSE:—Mix three parts Mineral Paint with one part white lead, thin with Linseed oil: if a lighter color is wanted, mix less paint, more lead.

ROOF:—Five parts of Mineral Paint, one part white Lead; mix with Linseed oil. Put it thick on a tin Roof as one coat when properly applied will last three years.

S. C. BRADSHAW, Agt.,

G. T. FOUQUE, Superintendent.

WORKS, North Beach; Office, 318 California st., San Francisco.

## WRIGHT'S PICKS.

JOHN WRIGHT, of Sacramento, has established himself in San Francisco for the manufacture of every description of PICKS, of the best material, at reduced prices. PICK EYES of the best iron furnished in any quantity, at low rates. Orders from the country promptly attended to. N. B.—None genuine unless stamped with my name.

JOHN WRIGHT, 511 Market street, Opposite Battery, San Francisco.

## REMOVAL.

OFFICE OF THE PACIFIC METALurgical Office is removed to 318 California street. Having enlarged our Works at North Beach, we are now enabled to reduce from 10 to 15 tons of Silver or Gold rock per day.

Gold and Silver ore, and Sulphuret Assayers', or Silversmiths' sweepings reduced or purchased.

COPPER ORES—Highest market rates advanced in cash, for shipments. S. C. BRADSHAW, Agent, 318 California street, near Sansone, up stairs.

## SPECIAL NOTICES.

Office of the San Francisco Gold and Silver Mining Company, San Francisco, March 16, 1863. The Annual Meeting of the above named Company will be held at the Company's Office, No. 7 Montgomery Block, on Monday, April 6, at 1 o'clock, P. M.  
Mar. 16-td J. H. BLOOD, Secretary.

Office of the Tennessee Gold and Silver Mining Company, San Francisco, March, 16, 1863.—The Annual Meeting of the Stockholders of the above named Company will be held at the company's Office, No. 7, Montgomery Block, on Monday, April 6, 1863.

**Volcanic Smelting Furnace.**

PERSONS DESIRING INFORMATION AS TO THE USE of a d economical properties of this Furnace, and intending to make use of the same, when satisfied of its superiority over all other means of reducing ores and separating metals from the sulphurets, can obtain all needed explanation and advice in regard to the same, and the terms of sale of rights to use the same, on application Col J. D. Stevenson or T. Ogg Shaw, or by letter to the proprietress through the Post Office of San Francisco. Drawings may be seen at the office of Col. J. D. Stevenson, No. 614 Merchant street, or at the office of T. Ogg Shaw, in Brannan's Building, Montgomery street.

The time required for reducing ores by this Furnace is from three to eight hours, and the amount of fuel only one-tenth as much as is consumed by other processes.

The process of condensation is applied to this Furnace which will save all those portions of precious metals

which usually escape in a volatile form. The attention of all interested in the subject is requested to examine the important results obtained by this process.

Parties wishing will be allowed to erect a trial Furnace of a capacity for smelting one ton of ore or more, on signing an obligation to pay the usual fee for the right to use it, should they continue to make use of the invention for a longer period than two months.  
mch 16 MRS. E. J. HALL, M.D., Proprietress.

**New Style of Lady's Buckle.**

**W. BOHM, INVENTOR & PATENTEE**

THE SUBSCRIBER HAVING OBTAINED LETTERS PATENT from Washington for an improvement in the construction of Ladies' Buckles, is now ready to furnish the same in every variety of style. This buckle possesses several very important improvements over any other in use.

The invention having been carefully examined at the Patent Office, has been adjudged to be a useful improvement, and Letters Patent have been granted for 17 years. It exceeds all other buckles in

**Usefulness, Strength and Appearance.**

The Public is respectfully invited to call and examine this Buckle at the Jewelry Establishment of

Real Estate Purchased and sold, and Loans Negotiated.

**WHEELER'S****Amalgamating and Separating Pans.**

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of triturating, and in cleaning up. By the introduction of the Separating Pan to follow the triturating this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

\* \* \* These Pans may be seen in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves.

#### MORE ABOUT THE "KEITH PROCESS" FOR DESULPHURIZING ORES.

In a late issue of the Press we gave some account of a new process, for calcining or desulphurizing ores; with a promise to report further upon the matter whenever anything new came to hand. This process has been introduced at Blackhawk in the Pike's Peak mines and is known as the Keith process. We quote, as before, from the letter of a correspondent of the Territorial *Enterprise* :—

"The process is a more sensible plan of working than any I saw in the country. It may not be all its owners claim for it, but it is a move in the right direction, and with such improvements as may from time to time be suggested, will eventually be the mode used throughout the Colorado mines. As this process differs in some respects from those in use in Washoe, it will doubtless be interesting to our millmen to read a description of it. The ores of the country contain a very large amount of sulphur, and this has been a source of great trouble to millmen. It is apt to combine with the quicksilver, destroying its metallic character and causing it to granulate. This effect is more readily produced when warm water is used in the batteries, therefore only cold water is used. Some attempts were made a year or two ago to desulphurize the ores, but without much success. Not that the sulphur cannot as easily be burned out of their ores as out of our own, but the mode of operation was defective. They attempted to burn the sulphur out of the lumps of ore just as they came from the mine. This they tried to do by piling it up in kilns, built exactly like lime-kilns, and burning it as lime is burned. This only glazed the ore on the outside and melted the sulphur without dissipating it. On breaking open lumps of the ore, streaks of melted sulphur could be seen through the mass. Until lately no one thought of first crushing and then burning the ore as a means of getting rid of the sulphur. I do not doubt but that the reverberatory furnaces used in some of our Washoe reduction-works would effectually desulphurize any of the Pike's Peak ores. But Keith's plan differs greatly from ours, and may be much better and cheaper. I don't know that a written description can be understood, but I will make it as plain as possible. In describing the desulphurizing apparatus it will also be necessary to mention a new grinding mill, called by its inventor the 'Young America.' The reader is not to imagine a mill built (as they generally are in Washoe) with one floor some eight or ten feet above the other. On the upper floor stands a masticator (the same as those used on the Pacific coast), which breaks the ore into small pieces. The pieces pass from the masticator into theopper of the 'Young America' mill. Now for said mill :—

The mill is simply a hollow drum or wheel of cast iron about two feet and a half in diameter and six inches thick, setting up edgewise as a common grindstone stands when hung. But this is not hung and does not revolve, but is securely fastened in a frame. The crushing machinery is inside of the circular shell, and consists of nothing more than a number of fan-shaped arms which revolve with very great velocity. These arms are slightly curved and toward their points widen out till they are nearly as wide as the shell within which they revolve. That is all there is of the mill, velocity does the rest. The fans revolve with such tremendous velocity that all the ore coming into it is knocked into an impalpable powder. The immense velocity of these fans surprises the attraction of cohesion in the particles of ore, and they instantly surrender in the shape of the finest dust. Now, when I come to tell how the dust gets out of the mill I approach the desulphurizing apparatus. The fans of the mill, revolving as I have described them, of course, create a strong blast, like the blower of a foundry. This carries out the ore as fast as it becomes a powder—carries it out of the wheel, or mill,

and up a sheetiron tube about six inches in diameter (common stove-pipe,) to the furnace, some eight feet higher than the mill.

The furnace is a square brick structure, with a grate about three feet wide by four in length, and three feet high, in which a fire of common pine wood is built. The flame from this fire-place escapes into a chimney built in the shape of a muffle and, instead of rising upward, runs down toward the lower floors at an angle of forty-five degrees. The tube from the mill enters this muffle-shaped chimney at its upper end, just where the blaze from the furnace enters, and the strong current of air forced down it carries the flame through its whole length. It is claimed that much of the air forced into the chimney is consumed, as also all the sulphur contained in the ore, which in burning greatly intensifies the heat. There are several round holes, an inch or two in diameter, at intervals of three or four feet along both sides of the chimney. Through these, when the apparatus is in operation, a further supply of air than that furnished by the blower, is sucked in and assists in decomposing the sulphur contained in the ore. By the machinery above described, ore may be more quickly and perfectly burned than by any other plan I have ever seen.

In passing down the flue, or chimney, the pulverized ore is blown as dust through a jet of flame for a distance of about twenty feet—the length of the flue—and each particle being separate, is surrounded by air and a strong flame—in fact, is itself a red hot, blazing spark, with nothing resting upon it or confining it. It is in itself a miniature meteor, with plenty of room in which to give off its sulphur, arsenic and other volatile constituents. After passing down the flue, it falls into a receptacle of brick-work, whence it is raked out upon an earthen floor to cool. The ore now presents about the same appearance as that burned in a reverberatory furnace—a brick red. The amalgamating machinery is simply an arastra about eight feet in diameter, with a stone bottom and drag-stones. The sides or rim of this arastra is of copper plate.

Mr Keith claims that with this machinery he can extract one thousand dollars per cord from rock which heretofore, by the old process, has only yielded two hundred and fifty dollars per cord. The expense will be one hundred dollars per cord, leaving nine hundred dollars clear. [A cord of ore as measured in Pike's Peak, varies from 5 to 8 tons, according as the same may be heavy or light.] One-third of a cord of ore was tested by this new process, during my stay in Central City, and yielded at the rate of about eight hundred dollars per ton, where the old yield was thirty one dollars and twenty-five cents per ton. This was a most satisfactory result when we consider that it was the first attempt with the new apparatus. The mill men of Colorado have been sluicing twice as much gold into the ravines as they have saved. They have long known this, but they were all poor and afraid to venture upon any kind of experiments. Not a single man of capital has ever attempted the reduction of the ores of this country. All who have engaged in the business have been men of small means. Some of these have now become wealthy and are just beginning to think of improved machinery and processes."

There is much of novelty and perhaps of value, both in the crushing and desulphurizing process, as described above. The reduction apparatus, spoken of as the "Young America" mill is constructed much after the manner of Pond's crusher, which was illustrated in our issue of March 16th, and almost precisely like the "smut mills" used in the wheat growing states, at the East. The process for desulphurization is certainly very ingenious and quite new. If it will accomplish a tithe of what its projectors claim, it must prove of great value. The results given, as yet, appear to be but experiments. It stands the test of continual and

practical use it must, and will soon find its way into general use. We shall carefully watch for further results, and shall lay them before our readers as soon as obtained. The objections, spoken of in our first notice of this process, are not yet entirely removed from our mind. We trust, however, for the success of the general interest of quartz mining, that this process may accomplish all that is claimed for it.

#### THE MINERALOGY OF THE OVERLAND ROUTE.

We have heretofore given several interesting extracts from letters written by "Dan de Quille," to the Territorial *Enterprise*, during his late trip by the Overland stage-coach to the East. We now copy the following from his latest published letter :—

"The country shows nothing but sedimentary rocks from the Webber to the Black Hills. Coal is found cropping out on Green river, on Bitter Creek, and in several other places on the route. On the Yellow Creek hills, which we get into soon after leaving Echo Cañon, we found our road obliterated by the snow having drifted over it, but we had a strong team of six mules, and passed over the range without difficulty or delay. The Bitter Creek country is the most barren, bleak and dreary on the whole route. It is really a bitter looking region, and bitter must be the lot of those whose fate it is to keep the stations of the Overland Company in this desolate place.

A COAL OIL might be had here with very little trouble. It drips out of the rocks in one place along a ravine. At one of the stations they told me that they sometimes dug out this rock and used it for fuel. They supposed it to be some kind of coal, yet were puzzled to know what to make of the stuff, as it was not the color of coal and presented much the appearance of any other shelly rock. It was in no wise reduced in bulk by burning, and after the grease stopped stewing out of it, it would go out entirely. Their coal was simply slaty rock completely saturated with coal oil. Were this in Nevada Territory or California, it would be a fortune worth securing, and it may be of value, situated as it is, in Bitter Creek Valley.

SILVER INDICATIONS.—We passed through the greater part of the Black Hills in the night, and had little chance of examining their formation; but when we first entered them I noticed several quartz veins crossing the road. These had more the appearance of being silver-bearing than auriferous, and resembled some of the ores of Palmyra District, Nevada Territory. Judging by what I saw of the country, I should say that paying mines exist in these mountains, at least on their western slope.

THE NORTH PACIFIC REVIEW for April has been laid on our table, and contains a variety of attractive reading matter. The present number is embellished with a spirited and life like lithograph of Gen. Joseph Hooker. Mr. W. Warren, Esq., retires from the editorial chair, and the Magazine will hereafter be conducted by Messrs. Dalgliesh & Co.

THE CALIFORNIA NAUTICAL MAGAZINE for April has a good table of contents, chiefly adapted to its own peculiar sphere.

ANOTHER MONSTER DIAMOND.—Late Havre papers speak of a diamond recently found by a negro in Brazil, far exceeding in dimensions the famous Koh-i-noor: They say that Sambo intends to appropriate the proceeds, to the establishment of a settlement for free blacks.

## GOLD MINING IN WALES, (ENG.)—NEW MINING MACHINERY.

The returns of the British mines for 1861 contain the first actual report of gold produced from a mine in England. This gold was taken from a quartz lode in Dollely, Merionethshire. The natural consequence of this discovery was the formation of numerous companies to work other lodes of a similar character in North Wales, in the progress of which considerable interest is felt among British mining circles.

We learn by a paragraph in the London *Mining Journal* of Jan. 20th, that these companies have met with similar troubles with regard to the saving of the mineral which was, and still is encountered by the gold miners of California. A correspondent of the *Journal* says that "Several modes of extraction have been experimented upon, and have generally, if not totally failed. The last attempt was to be perfect; there was to be no mistake about it; but the result of that, again, was that about 17 ounces of gold, per ton, was extracted from the tailings." Here, we appear to have the early days of California repeated in the ancient mining region of Wales. At present, it is said that but two gold mines, there, are making regular returns. Quite a discussion has also been going on as to the relative merits of the ordinary Stamps and "Berdan's Crusher," for reducing the rock. Berdan's machine seems to have the inside track. In alluding to different operators, the correspondent of the *Journal* says:—

"John Perry has an average yield of about 7 ozs. of gold per ton from the Vigna and Clagan; and old Owen Evans gets a constant yield of 4 to 5 ozs. per ton in the Welsh Gold Mining Co's mine, at Ceinced. The last named person is a most unassuming man, but he has given years of study and nights of anxiety to the gold question, and he firmly believes he has mastered it.

From want of the aid which a really practical worker could render, most substantial buildings have been erected, water-wheels and steam engines ditto, stamps and crushers attached, amalgamating machines, in barrels, pans, troughs, etc., and a rivulet of mercury has run to waste, in fruitless attempts to catch the gold; men as able and as keen as the late Sir Robert Peel, have had to do with these works as shareholders and managers, they have brought to bear upon the subject a vast amount of skill, experience, industry and capital. Their only failure was, they did not, as we may say, "chalk their bobbins."

There is another veteran in the gold business in Dollely; I allude to Robert M. Roberts, who was connected with the late Mr. Harvey in all his gold researches. The person I have named will tell you that in the Merionethshire quartz, there is a substance difficult to overcome at first, and the presence of that substance is the cause of a large amount of failures. To overcome it is as easy as to 'chalk your bobbins.' They have overcome it, and have extracted gold from all quartz in which it was contained. If any director, shareholder or manager of gold mines should be embarrassed, or wish instruction, I would recommend to consult Perry, Evans or Roberts on the subject of gold quartz. I am glad to say they are called upon sometimes to give an opinion. In Dollely these opinions are safe to follow. It is not the purpose of this communication to ignore any of the efforts of the eminent men, gentlemen of very great attainments, who are engaged in solving the problem of extracting gold, profitably, in Wales."

An old Californian, well known as a former resident of this city, and once extensively engaged in mining enterprises on this coast, is also operating largely among the new found English gold mines. He is noticed as follows, in the same communication from which we make the above extracts:—

"I would also add that Mr. Mosheimer has the charge of erecting an extensive series of machinery in three or four different mines. I have seen the castings of 'Mosheimer's Patent,' and from the well known ingenuity and experience of this gentleman, down to 'chalk your bobbins,' I firmly believe he will overcome every obstacle, and that his reduction-works will be an honor to himself, and a profit to his friends."

From the last paragraph it will be observed that Mr. Mosheimer has devised a new class of machinery for the reduction of quartz and the extraction of the mineral therefrom. From letters received in this city, we understand that Mr. M. crushes the quartz dry; that he has secured letters patent for the same in England, and taken the necessary steps to do the same in this country. We shall probably soon be able to give an illustrated description of this machinery in the MINING AND SCIENTIFIC PRESS.

COAL has been discovered about 70 miles east of Star city, Humboldt, and parties are now engaged in examining the locality, with the view of learning its capacity and value as a fuel and practicability for working.

## INVESTMENTS IN THE INTERIOR.—HOPEFUL PROSPECTS.

It is a significant and most important fact that an excess of about \$10,000,000 in coin has been sent into the interior over, and above coin remittances from that direction during the past year. The necessary deductions from this fact are that this balance has been absorbed, within the period referred to in the operations of internal commerce, in the expansion of agriculture, the opening and working of the mines, the building up of manufacturing establishments, and such other uses as are incident to the thrift and enterprise of an industrious and prosperous people.

The rapidly increasing area of our mineral developments, and the new and improved methods now being introduced for the reduction of ores and the extraction of minerals therefrom, together with the rapid formation of new companies for prospecting and working, imparts to this leading interest of industry a degree of excitement and energy rarely witnessed in any industrial pursuit.

With the incoming of the year we have witnessed the springing up of an entirely new branch of mining industry, and one which bids fair to rival in extent and importance either silver or gold. The existence of a copper belt inexhaustible in its yields, and extending throughout the entire length of the State, is now a universally acknowledged fact. The bearing which this new development is destined to exert upon the future growth and prosperity of the State is, just now, a theme of most hopeful and animated discussion.

The copious rains, with which we have recently been visited, have set to rest all apprehensions with regard to short crops in our agricultural districts, while the large accumulations of snow upon the mountains assure the miner that his summer supply of water will be fully equal to the ordinary amount. The failure of the usual supply of water to the miner, in the early part of the season has been more than compensated, in the increased facility such lack of rain has given to prospectors and operators in auriferous quartz and copper. With the success of all other branches of industry our mercantile classes have the fullest assurance of an abundant demand for every description of merchandise suitable to the California trade.

A WEATHER PROPHECY.—George Shepherd, Civil Engineer, is furnishing the London *Mining Journal*, with weekly predictions of the state of the weather, etc. founded on philosophical and scientific calculations, which are attracting considerable attention. In his letter of Jan. 20, 1863, he says:

"I regret that my absence from London on professional business, prevented me from foretelling the approach of the late severe gales, which caused such havoc on our coasts."

With regard to looming events; strong winds will occur about the 28th inst., also about Feb. 3d. I have already foretold we shall have an early spring; we shall also have a fine summer and autumn, and weather all that could be desired for the next harvest. But the year 1864, I again repeat, will bring sorrow, perplexity and trouble on the English nation generally. [Perhaps the prophet sees "English Intervention," in American affairs coming up in the early future—Ed. PRESS.] There cannot be a doubt but that our winters are gradually improving. How long it will continue to be so we must leave to the wise Dispenser of all things. To all appearances another comet is approaching the sun, and will be discovered very shortly. This, however, I leave to our astronomers, who have more time to search the heavens than I have. I wish I had more leisure for this interesting subject."

HOW TO TELL THE VALUE OF GREENBACKS.—Many persons find it difficult to compute the value of paper money when gold commands a premium. A simple and invariable rule to arrive at the value of paper money when gold commands a certain premium is to multiply 100 by the amount of the premium on gold and divide the product by 100 with the amount of premium added; the result shows the exact amount of the discount on paper money. For example: Say gold is quoted at 60 cents premium in New York; multiply 100 by 60 and the product is 6,000; divide this by 160 and the result is 37½, which is the exact discount on the paper money, and shows that when gold commands a premium of 60 cents on the dollar paper money is worth 62½ cents on the dollar.

FROM HUMBOLDT.—We received a call, on Saturday, from William Holcomb, Esq., of Humboldt, N. T. Mr. H. left upon our table specimens from several of the principal leads in the Buena Vista District; among them we notice the Schuykill, Sargent, Camelion, Comet Corner, and Mars. The former is an exceedingly rich lode, and the specimen before us, which has been subjected to the action of fire is completely coated with silver, that has been brought out by the heat. The claims above enumerated are all considered very valuable, and measures are being taken to have them thoroughly developed. The specimens before us are unlike those usually found about Virginia City. They consist, so far as we can judge by the eye, chiefly of Horn Silver, which is usually considered very valuable as a silver ore, and is easily worked. They present the usual shades of this ore from green to a yellowish brown and dark blue, and are evidently very rich. We notice very little appearance of sulphurets, except in one from the "magna charta," a lead in Santa Clara District. These specimens may now be seen at W. P. Denckla & Co., No. 508 Montgomery St.

MINING IN AUSTRIA.—The Austrian Government is among the most liberal of the European Powers, in its encouragement of mining enterprise. The country possesses a large variety of minerals, from gold and the other precious metals, down (or rather up) to iron, and coal. Large numbers of foreigners, (especially Englishmen) are engaged in mining in that country, and extensive developments have already been made; yet there is a vast extent of mining territory still undeveloped. The Government gives to those desirous to engage in mining, important facilities, and "concessions" or permits to mine, cost but a trifle compared to similar requirements in other European countries. In England, a man who desires to embark in gold mining, must first pay down a fee of about \$25, and then pay over to the Government one twelfth of all the gold produced. This rule, we believe, also holds good in mining for other minerals. In Austria, a man pays \$5 for his "concession," and but one fifth of the net, instead of the gross produce, as in England.

## Mining and Scientific Press.

The MINING AND SCIENTIFIC PRESS is published at the Exchange Building, Room 27, corner of Battery and Washington streets San Francisco, Cal., at FIFTY CENTS per month, or \$4 per annum, in advance.

C. W. M. SMITH and W. B. EWER, - - - - Proprietors

## Engravings, Electrotypes, etc.

We execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEREOTYPING and ELECTROTYPING, Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals, &c. Plain or Colored Printing. Job Work executed with dispatch at low rates. PATRONS will remember that when we execute engravings we will insure them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

## To Printers.

AN INTEREST in one of the most flourishing and best paying Newspaper Offices in the mountains is offered for sale on easy terms. A rare opportunity is hereby presented to any printer desirous of establishing himself in a good business in one of the healthiest, most thriving and delightful mountain towns in the state. For further information enquire at this office.

SUBSCRIBE.—Are you a miner and not a subscriber to the MINING AND SCIENTIFIC PRESS? If so, you are an annual loser of many times the price of a year's subscription, particularly if you are engaged in quartz mining. The same amount of practical information, important to miners and mechanics, which is contained in a volume of the PRESS, cannot be bought from the shelves of any bookstore in the country for the price of several year's subscription. Do you ever send a paper to the "Old Folks at Home?" If so, and you desire to send important information and valuable reading matter, you can find no paper that will be read with so much eagerness by them, or one that will convey to them so full an account of the real industry of the country as the MINING AND SCIENTIFIC PRESS. We invite all to send us their names and four dollars, or two dollars for six months, to become patrons of the only mining paper printed on the Pacific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examination, and with the hope that it may so far meet with their approval as to warrant their subscribing for it at once. I do not our usual custom to receive a subscriber for less than six months; but inasmuch as we are anxious to introduce the paper where it is not now known, we will, for the present, send the PRESS for three months even, on the receipt of one dollar, in coin or stamps. It is our belief that no one will wish to discontinue the paper after being a constant reader of it for even that short period.

## SAN FRANCISCO MINING NOTICES.

## ASSESSMENTS LEVIED.

Assessments upon Mining Stocks have been levied as follows:—

Garibaldi.—Assessment of \$1 per share, levied March 2nd.

Sutro.—Assessment of \$1 per share, levied Feb. 23, payable March 23.

Silver Quartz Mill Co.—Assessment of 5 per cent. levied Feb. 23, payable March 28.

Helvetia.—Assessment of 25 cts. per share, levied Feb. 17, payable March 10.

Zouave.—Assessment of \$1 levied Feb. 22, payable Mar. 21.

Rogers.—Assessment of \$5 per share levied Feb. 4, payable Mar. 15.

Sam Wright.—Assessment of 50 cts. per share levied Mar. 2, payable immediately, delinquents to be sold Apr. 2.

Napoleon (copper).—Assessments of \$3 per share levied Mar. 3, payable in 30 days.

Golden Age.—Assessment of one dollar per share levied Feb. 24, payable March 26.

Washoe Gold & Silver.—An assessment of 2 per cent. on capital stock was levied Feb. 16, payable Apr. 1.

Rhodes' Diggings.—Assessment of 25 cts. per share levied Feb. 26, payable Mar. 5.

Texas Co., at a Meeting held Feb. 14, levied an assessment of one dollar per share, payable to the Secretary in Virginia City.

Santa Rosa Co.—February assessment of 20 cents per share now due and payable.

Madison Co.—An assessment, two dollars per share, was levied Feb. 17, payable immediately, at Office, 600 Merchant St.

Union Co.—An assessment of one dollar per share was levied February 16, payable on or before March 25.

Penn Co.—An assessment of \$3 per share was levied Feb. 5, one half payable March 1, balance April 15.

Kossuth Co., Devil's Gate District.—An assessment of 10 cts. per share was levied Feb. 7.

Constitution Company levied an assessment of 25 cts. per Feb. 11, payable immediately.

La Plata Oro Co. levied an assessment of five dollars per share, Feb. 9, payable at Office of the Secretary in Virginia City.

La Plata Co. levied an assessment of 50 cts. per share Feb. 2nd, payable at Office of the President.

Alamo Co. levied an assessment of 50 cts. per share, Feb. 11, payable on or before March 20, at 115 Cal. Street San Francisco, or at office in Carson City.

Tucker Co. levied an assessment of 25 cts. per share, Feb. 11, payable immediately at 608 Merchant St.

Hawley Co. levied an assessment of one dollar per share, on Feb. 9, payable on or before March 12, to Superintendent at the mine, or Secretary at Office.

Slate Range Co. levied an assessment of 50 cts. per share, Feb. 4, payable, March 15.

Moss G. & S. M. Co.—An assessment of 50 cents per share was levied Jan. 27, payable at 428, Montgomery St., or to the Superintendent at the mine.

White Cloud G. & S. M. Co. levied an assessment of 75 cents per share, Jan. 27, payable to the Secretary, at 428, Montgomery St.

El Dorado G. & S. M. Co.—An assessment of One Dollar per share was levied Jan. 23, payable to the Sec. or to the Supt.

Gaudaloupe S. M. Co.—An assessment of \$30 per share was levied, payable on or before March 1st.

El Tesora Mining Co.—An assessment of \$1½ was levied Jan. 27, payable at office on or before Feb. 27.

Polar Star G. & S. M. Co. levied an assessment of 50 cents per share, February 4th, payable on or before the 4th of March, at the Office in this city or to the Superintendent at the mine in Aurora, (Esmeralda.)

Dios Padre G. & S. M. Co. levied an assessment of 3 dollars per share, Jan. 31, payable in 30 days, also an assessment of 2 dollars per share, payable in 60 days, at office 502 Montgomery street.

Beckwith G. & S. Mining Co.—An assessment of 25 cents per share was levied Jan. 24, payable immediately.

Sonora Mining Co.—An assessment of 25 cents per share was levied, Jan 23, payable immediately.

Overman Mining Co.—25 cents per foot, Jan. 29, payable within ten days.

Chs. Caney Mining Co.—50 cents per share, Jan. 21, payable on or before Feb. 20th.

Sierra S. M. Co. An Assessment of \$2½ was levied Jan. 22—payable immediately, at Office 575 Mission St.

Mount Davidson Co.—An Assessment of 50 cents per Share was levied, Jan. 23, payable on or before March 1st, at Office 47 Montgomery Block.

Airatic.—Fifty cents per share, payable at No. 4 Armory Hall, San Francisco, or to the Superintendent at the Mine.

Hattie G. & S. M. Co.—Thirty cents per share, levied Jan. 31, payable at Office in San Francisco, or at the Mine.

Hale & Norcross.—Assessment of Ten Dollars per Share, levied Jan. 31—payable at the Office in this city, or to John Skae, at the Mine, on or before Feb. 25.

Mina Prieta S. M. Co.—An Assessment of Five Dollars per Share was levied, Jan. 31, payable on or before March 5th—at Office, cor. Montgomery & Jackson Sts.

Recorder Mining Co.—An Assessment of One Dollar per foot was levied Jan. 19, payable half on or before Feb. 18, and balance on or before March 20.

Hale & Norcross S. M. Co. have levied an assessment of \$5 per share payable on or before Jan. 26th.

Martin White.—An assessment of 20 cts. a share was levied, Jan. 2.

Oriental G. & S. M. Co.—An assessment of 50 cts. per share was levied, Jan. 14, payable at Office, cor. Sutton Avenue and C St., Virginia City.

Baltimore America Consolidated.—An assessment of 50 cents per share was levied, Jan. 5.

Savage.—An assessment of \$35 cents per share was levied, Jan. 7.

Hawley.—An assessment of \$1.00 per share was levied Feb. 9, payable March 12.

Cole S. M. Co.—An assessment of One Dollar per share was levied, Jan. 10, payable, Feb. 1.

United States M. Co.—An assessment of six and two-thirds cts. per share was levied Jan. 10, 1863, payable to the Superintendent at the mine, or to the Secretary, Rooms 7 and 8, Government House, San Francisco.

Sierra Nevada S. M. Co. levied an assessment of \$15 per share, Jan. 15—payable Feb. 18.

Lady Bryan.—An assessment of 70 cts. was levied, Jan. 13, payable on or before Feb. 16.

Ida G. & S. Co. (Russ District)—An assessment of \$1 was levied, Jan. 14.

## ASSESSMENT SALES.

Sales of Stock for non-payment of assessments are advertised to be sold as follows:—

Oriental Tunnel Co. will sell, on Saturday, Mar. 28.

Mars will institute proceedings against delinquents, Mar. 16th.

Planet will institute proceedings against delinquents Mar. 16th.

Moray Co. (V. City.—Suits for delinquent assessments will be commenced, March 14.

Michigan Co. (Gold Hill) will commence suits for delinquent assessments, March 16.

Lady Bryan G. & S. M. Co.—Shares of delinquent stockholders will be sold at auction for assessments, at No. 400, Montgomery street, on Jan. 27.

## GENERAL NOTICES.

Yellow Jacket.—Corporate Deed now ready for signature at office of H. G. Maynard, Gold Hill, N. T.

Jenny Lind (Esmeralda).—Owners of ground in this Cot are requestes to call and sign deed of trust at 608 Merchans St.

Mount Hope Co.—Persons claiming stock are requested to present title papers for examination till March 16.

U. S. Mining Co.—All persons claiming stock are requested to present title papers for examination at Nos. 7 & 8 Government House.

Caution.—D. M. Tyrell warns persons against purchasing a certain 10 feet of ground in the Wellington Co., standing in the name of J. B. Magee—also 20 feet, standing in name of W. Williams. (See Territorial Enterprise.)

Ashland Co.—L. A. Gould, in the name of the Moss Co. notifies the Ashland Co. that their westerly drift has cut the Lamb ledge, in the Moss Co.'s ground, from which the Ashland Co. is forbidden to extract any valuable metals.

Coso Silver Mining Co.—The Office of this Company has been removed from the Stevenson House to Nos. 11 and 13 Court Block, No. 636 Clay street between Montgomery and Kearny. Entrance on both Clay and Merchant streets.

THE SWEETZ, Co., Gold Hill, give notice that Baltic

Company have wrongfully claimed and worked their ground since July, 1860.

THE CHIMNEY ROCK Co., lying next west of the Virginia Co. claims have notified the Hazel Green, Tingley and Bach & Paxton Companies that they are trespassing upon the Chimney Rock Co's ground.

## MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

THIRD YEAR! VOLUME VI.—NEW SERIES!

A new volume of this extensively circulated paper commenced Sept. 11, 1862. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

## The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

## The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

## The Mechanic and Manufacturer!

Will be greatly benefitted by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

## To Chemists, Architects, Millwrights and Farmers!

This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

## Terms.

To mail subscribers:—Four Dollars per annum.

## Club Rates.

Five Copies for Six Months, \$8.

Ten Copies for Six Months, \$16.

Ten Copies for Twelve Months, \$30.

Fifteen Copies for Twelve Months, \$44.

Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 80

Names can be sent in at different times and from different Post-offices

Specimen copies will be sent gratis to any part of the country.

## EWER &amp; SMITH, Publishers,

Room 27, (formerly) U. S. Court Building, Corner of Washington and Paterson streets, San Francisco.

**DR. VAN ZANDT,**  
Consulting Physician and Surgeon.  
OFFICE:

Corner of Washington and Sansome Streets.

The Great Success of this Century, as an Aid to Practical Medicine.

The Mysterious Problem of Material Nature, Electricity Made Subservient for the Cure of all Nervous and Spinal Diseases

**THAT THIS PRINCIPLE**, successfully applied to diseased states of the system, is to prove the great sought-for necessity, long wanting by physicians to aid their medicines in overcoming organic and functional derangements of the human body. It is a part of the great principle of vitality known as nervous influence and necessarily must have much to do in obviating diseased action.

## Too Much Cannot Be Said

In its praise; for it is highly probable that in health there is an exact equilibrium of the ELECTRIC principle; and should this secret and hidden equipoise of health be broken or lowered—should the body be negatively electrified when it should be positively charged—is not the current broken, and is there not a war of forces going on in our system? This needs correcting, and in order that the tissues of the body should be susceptible to remedial agents we must first restore and

## Awaken the Magnetic Life Within Us.

The spinal and sympathetic nerve systems. Believing as I do most firmly in this great magnetic or electrical intensity of the earth, with its influence upon our bodies in health and disease, I am led to take advantage of the press, through which to awaken attention to the subject, that good may come to all.

C. W. THOMAS, Plaining Mill, California street, facing the Mission R. R. Depot. San Francisco.

TURNER, MARSH & OSGOOD, Successors to C. O. Turner & Co., Importers of Wines and Liquors, S. E. cor. Front and Sacramento sts.

D. R. J. B. BEERS—Dentist, 617 Clay street. All operations on the teeth performed in the most skillful and approved manner.

WILLIAM FELL, Notary Public for Storey County, N. T. Commissioner of Deeds for California Virginia City, N. T.

PALMER, HANSCOM & Co. Golden State Foundry and Machine Works (Formerly Sutter Iron Works.) First street near Market.

## MINING--BOGUS AND BONAFIDE.

Investments in mining properly are not necessarily so hazardous as most people imagine. In opening up new mineral regions, and in entering extensively upon fresh adventures in old mineral fields, speculation will unavoidably creep in, to a greater or less extent. It is well, perhaps, that it does so. Man is naturally indolent, and unless the imagination is brought into pretty active play, as a stimulus, it is seldom that he accomplishes much. This confession may be somewhat humiliating, but it is nevertheless true. Speculation—the desperate chances of large possible gain, combined with a natural desire for adventure, will often lead men of means to invest in mining operations, when all the calm matter-of-fact reasoning of the over cautious, will utterly fail to induce them to invest a dime. It is by such stimulus that almost all important mineral developments are brought out; developments, which, if left to the ordinary routine of business, would have continued hidden away in the secret recesses of the earth, for years and perhaps for centuries. So far, speculation is legitimate, and beneficial in enlarging the domain of industry. Individual losses may occur—they must, as an inevitable consequence; but the community is benefited, labor is provided for, commerce finds new channels, and the car of progress receives a renewed impulse in its onward course.

Here speculation, *per se*, ceases to be useful, and should blend in productiveness, by lending its aid to the actual development of such mines as promise a real value; while all others should be ignored. If the speculative world would be guided by such a course of operations, the public at large would not have so unfavorable an opinion of this class of mining as is now generally entertained. That it is not so directed at all times is a lamentable fact; but one for which the complaining public is quite as much to blame as the speculators themselves, as will hereinafter appear.

Speculative mining is confined chiefly to great commercial centres, where capital aggregates. That class of mining leads, in this State, may be found in greatest abundance on Montgomery street, in this city. The radiating point of these leads appears to be located somewhere between Washington and Merchant street. They "crop out" at intervals all along the first named thoroughfare. Their "indications" are distinct and unmistakable to the intelligent observer. The managers of this peculiar class of mines are usually denominated "brokers." Now brokers are a very useful and almost indispensable class of operators in all large centres of business. The community could not well do without them. Those of whom we are now writing may be divided into two classes—the *mining* broker, and the *market* broker. Both, we assume and hold to be honest. The former is the one who calculates the merits or demerits of a mine independent of the market. The latter is one who studies the market independent of the value or prospects of the mine.

Now, if "operating" in these mines were confined exclusively to the brokers themselves, and on their own account, it is evident that but little progress would be made in advancing their shares. Of course the chief business of the broker is to buy and sell for his client. Now it lies altogether with the client which class of brokers he shall employ. If his object is a legitimate operation, he will employ the one who prefers to operate on the actual merits of the mine. If otherwise, he seeks out the less conscientious agent who goes upon the street to "bull" and "bear" as the case may be, and put money in his own and his client's pocket, no matter at what sacrifice of principle. Such transactions are but little better, in their moral aspect, than the act of getting up a purely bogus mine, and selling in the market that which does not and cannot have a value. This class of operations are detrimental, in the highest degree, to all legitimate mining, and should be frowned upon by the entire community. The wrong in the case is usually attributable to the outside party, who if unsuccessful, is generally the first to complain of mining speculation. "Bulls" and "bears" are, however, sometimes serviceable, if they do not carry on their operations too steep. They are often the life of the market, and serve as the needed stimulus to action, not unfrequently being the immediate means, of bringing to life and activity mines of actual merit, which might otherwise have been allowed, perhaps for ages, to slumber in inaction.

## THE MINING MARKET.

The condition of the mining market, at the present time, is considered by many as somewhat ominous. Some confidently predict "a crash ahead," with "loss and suffering in store"—"a revulsion which will prove temporarily ruinous to our prosperity." We are not of those who adopt extreme views on either side. While we admit that an undue state of excitement exists in the community we still have no fear of any serious depression—anything at all commensurate with the present buoyancy of stocks. There may indeed be such an over eagerness to invest as to give opportunity for the introduction of purely speculative or absolutely bogus mines, but such cases will be rare indeed. Our field for mining operations is too wide, too rich and too varied to make such operations productive, to any extent. It actually requires less labor, and less financiering to hunt up, and place in the market genuine operations with fair prospects of success, than it does to resort to a purely fictitious basis. To say nothing of the splendid results already realized from numerous first class mines, there are even now so many, which were at first regarded as little better than "wild cat," which are now turning out better than was anticipated, that even the most cautious, are beginning to admit that we have too real and solid a basis, to be seriously affected by any number of unproductive adventures which present indications may warrant us to anticipate. The times however are somewhat propitious for inflated temporary operations, and it would be well for our citizens to act with more caution than heretofore in making investments. They should enquire more carefully into the merits and demerits of the mines in which they would invest, and exercise greater caution in the selection of agents, making careful enquiry as to their facilities and inclination to act as *mining* or *market* brokers. The same caution should be observed in the organization of companies, eschewing all operations not founded upon, at least, a fairly promising basis.

Mines under *bona fide* management, in good districts, with fair indications for future improvement and progress, must surely be worth investing in. *Progressive* mines are ever the most productive of wealth. It is this class of mines, almost exclusively, which, to-day, having only a nominal value of a few shillings or a few dollars a foot, tomorrow advance to a comparatively high figure, by some fortunate development, thus doubling, trebling or increasing ten or a hundred fold in a single day, the amount invested. The effect of an advance in one such, it will be readily seen, may more than compensate for a total loss in a great number of others. If you invest \$5 per in ten different companies, and only one of these goes up to \$100 per foot, you have doubled your entire investment, and have your chances still left in the other nine. The Mining List which we publish on the 6th page of this paper, exclusive of those of known and acknowledged value, reaches nearly 200 in number; we will call it just that number. As *progressive* mines, occupying a fair position as legitimate adventures, \$5 per foot, of assessments, ought to pretty definitely determine whether they possess sufficient value for legitimate and extensive mining operations. Now if only 20 of the 200 prove reliable, and advance to a value of \$200 per foot, the total amount of investment will be doubled. If two or three of the number should reach the standard of "first class," the proportionate increased value of the investment would be vastly increased. Now can any person with a knowledge of the brilliant successes and minor, yet important developments already made, entertain for a moment the idea that the list we give will ever be cut down to only 20 productive mines? Yet ten only, would save us from actual loss!

As that list now stands, either the Ophir or Gould & Curry, alone, is worth more money than the entire amount which has, up to this date, been expended on all the mines which appear in our list; and were every other mine on the list to prove a failure, except the two last mentioned, the community, as a whole would be a gainer in wealth. Inconsiderate speculation may be carried to an extent which will work a limited injury to a few individuals; but it is idle and preposterous to talk about anything like a general collapse in the incorporated mining interests of the State.

Efforts are being made in Australia to acclimatise in that region English swans, hares, pigeons, grouse, etc.

## WORDS OF ENCOURAGEMENT.

It is contrary to our usual custom to copy commendatory notices from our brethren of the Press, or to publish extracts from the numerous letters we receive, whose writers are so kind or so partial as to make especial and favorable mention of our efforts to furnish a paper which shall meet the wants of the mining public. Our course, in this respect, perhaps, is not so much the result of our innate modesty, as the consciousness that, notwithstanding the partiality of our correspondants, we really think the Press is yet far short of what such a paper should be. Although our circulation and other patronage is constantly increasing, it has not yet arrived at a point which will enable us to devote that time and money requisite to produce paper which shall properly represent the great and important mining interest of the Pacific coast. Our sheet is too small and the amount of matter to which we are limited, is quite too little to give the paper that variety and comprehensiveness, which the importance of the interest we represent demands. We hope, however, in a short time to be able, from the increase of our circulation and general business to do ourselves justice and to furnish our readers with a journal, which shall fully merit the good opinion which they have so generally expressed with regard to our efforts. We would take this occasion to express our thanks to those who have interested themselves in extending the circulation of the Press, both in this city, and throughout the State and adjoining Territories. We append extracts of several letters, which, with others, we have received during a single week, to the writers of which we are entire strangers:—

A subscriber near Carson City writes:—"In conclusion permit me to remark how well the mining interest of California and Nevada is now represented by your paper, and that I hope it will soon be the means of communication and interchange of opinion between members of the mining profession. Individual experience is always more or less limited; but if each mill-man or miner would but make known the results of this experience, a mass of information would be obtained, of the utmost value to all."

An enquiring correspondent from a small Mining Camp in Amador Co., writes:—"I have seen repeated notices of your publication, in the newspapers, but have never met with a number of it. It is doubtless such a paper as we miners need. Will you therefore be kind enough to send me a few numbers of it, in order that we may learn something about its character, terms, &c.?" [The papers have been duly forwarded as per request.]

A gentleman in Aurora (Esmeralda) where we already had a very good circulation, writes as follows:—

"MESSRS EWER AND SMITH:—I happened to see a copy of the MINING AND SCIENTIFIC PRESS a day or two since, and concluded to send and subscribe for it. But thought I would try to get a few names to join to my own for the sake of convenience in sending. The result was that a trial of an hour or two succeeded in getting 21 names, the money for which I herewith remit by check on W., F. & Co.

I hope to add yet more names to the list in a few days. I like the paper and wish to encourage it."

THE LOS ANGELES MINES.—The papers of Los Angeles are giving encouraging accounts of the mines in that county. They are going ahead rapidly in the Soledad district. Fine gray sulphuret of copper has been struck in the Mars shaft at a depth of 45 feet. The Santa Clara Company have found rich gold quartz on the Eureka lode. The Los Angeles Consolidated Mining Company, having completed the assessments on their fifteen lodes, will soon be ready for a most thorough work. They are now sinking upon the Eureka, first South Extension. It is expected that they will reach the main vein in a few weeks. The outcroppings and float rock in the extension above named, assay equal to the rock taken from the discovery claim.

THE HUMBOLDT MINES.—The success of the mining interest of the Humboldt district, exceeds the expectations of the most sanguine. We look for important developments from this region during the coming summer. Besides gold and silver, there has been found in this district, coal, salt, saltpeter, cement, cinnebar, and a species of building rock said to be superior to anything on the continent, in quality and the facilities of quarrying and preparing it for use.

## THE IMPERIAL SILVER MINING COMPANY OF WASHOE.

This company, which has now been placed in the first rank of dividend paying companies, has recently been formed by a consolidation of the Washoe Gold and Silver Mining Co., No. 1; the Holmes Co., and the Alta Company. The Company, as now organized holds 183½ feet of ground on Gold Hill and owns the Rock Point Mills, which cost \$250,000 and the Nevada Mills, which cost \$150,000. The capital stock consists of \$1,000,000, divided into 2,000 shares at \$500 each. No assessments have ever been called for. The entire expense of opening the mine and constructing the mills, etc., has been drawn from the mine itself, as in the case of the Ophir. The dividend which was declared, a few days since, 2½ per cent. for one and a-half months, on the capital stock, is equivalent to a monthly dividend of \$100 per foot. This dividend was independent of a reserve of \$10,000 toward a contingent fund. The company commenced crushing on the 15th of February last. Samuel Merritt, M. D., is President of the Company and C. T. Hopkins, Secretary. Office at 405 Front street.

**VIRGINIA AND TRUCKEE RAILROAD.**—A bill creating the "Virginia City and Truckee Railroad Company, with a branch to Carson," was passed at the late session of the Nevada Legislature. John H. Atchinson, Gov. Johnson, Theodore Winters, and other substantial citizens are among the incorporators. John F. Kidder, engineer of the road, is in Virginia City, and will immediately begin a preliminary survey of the line.

## GENERAL MINING STOCK REPORT.

## REPORT OF SALES

At the San Francisco Mining Stock Board,  
For the week ending April 4th, 1883.

Names of Companies.	Total No. Shrs.	Shares per ft.	Par Value.	Monday.	Tuesday.	Wednesday.	Thursday.	Friday.	Saturday.

## REMARKS.

The business of the week has been unusually active and large. The amount of transactions have exceeded \$400,000, and embrace a very extensive range of stocks. First class shares have come in for a larger share of attention than for several weeks previous. The usual fluctuations have been noticed.

Ophir, which opened at \$2500, gradually declined to \$2430 and 2400. The purchase account of the Old Virginia claim closes with the present month, and the former dividend of \$72 per foot may be hereafter expected, which will doubtless have a favorable influence upon the stock.

Savage has still further advanced under encouraging advices from the mine. 46 shares changed hands at \$1400 b. 60 bs.

Chollar has declined slightly, in prospect of heavy assessments to meet costs of recent litigation and the expenses.  
Burning Moscow has experienced considerable fluctuation and closed the week at a slight decline.

Lady Bryan has also suffered much fluctuation; commencing the week at \$22, it declined to \$13, subsequently, and closed at \$20 b. 30 ds.

Wide West after experiencing considerable fluctuation closed the week at considerable advance. Antelope also advanced about \$60.

We subjoin our usual record of transactions:

## WASHOE STOCK REMARKS.

For the week ending March 28th 1883.

[Compiled from the Daily Territorial Enterprise.]

The business of the past week has been large and generally satisfactory. Stocks to an unusual large amount have changed hands, mostly at advanced prices. The claims sharing the principal attention during the past week have been the Lady Bryan, Shamrock, Fairview, Bloomington, Harrison, Grass Valley, Burning Moscow, Burnside, Laboring, Eureka, Overman, Belcher, Leon, Union, Pines, Zouave, etc.

Reese River stock is being dealt in sparingly. \$30 is offered for Masonic, on Lander Ledge, and Comet and Blue Lead are saleable at variable rates. Gold Hill stocks are still meeting with marked favor.

The Lady Bryan has been the chief object of attraction during the week. The new interest with regard to this mine has been caused by a strike of rich rock, much resembling 2nd class Ophir. This stock has gradually advanced during the past week from \$10 to \$17, at which latter figure it closed with an upward tendency. \$9 to \$25 is generally asked.

Grass Valley, which has been favorably operated upon by the Chollar-Potosi decision, gradually advanced from \$10 to \$36 and \$36, which latter figure it reached on the 24th inst. From that time it commenced to decline and at the present close of the week it may be quoted at \$20 to \$25, with a downward tendency.

Burning Moscow, was in the market in small lots on Wednesday, at \$200, without purchasers. It was quoted on that day at \$100. On Saturday it had declined to \$100, yet it is still held above quotations at the Bay.

Sacramento has been somewhat variable during the week. It was offered liberally at \$60 to \$65 on Tuesday, without takers. It improved slightly on Wednesday in consequence of orders from below, and still further advances are reported to-day. It may now be quoted firm at \$60 with demand. Mitou is again finding its way into market, but is held at \$85 to \$95.

Santa Rita is in light demand at an advance. It may be quoted at \$65. La Crosse, whenever offered at low rates is eagerly caught up.

Bloomington is in request at \$4 to \$5, and is marketable at these figures. Oriental has somewhat lost favor, which has been gained by the Dargan the elder title. The latter is saleable at from \$5 to \$6.

Utah is in market in small lots and is quotable at \$45 to \$50. Bullion is saleable at \$40 to \$45. Belcher is advancing.

El Dorado is rapidly gaining in the market and is held at \$90 to \$100.

Watson, the new consolidation north of the Madison, is held firmly at healthy rates. There is a light demand for it at \$8 to \$10, with little or none in market.

Fairview is readily purchased at \$45 to \$50.

Laboring, Gold Hill, has been in request all the week at \$10 to \$12, and 200 or 300 feet have changed hands at these figures. The company claims a ledge, if any there be, between the Union and Yellow Jacket.

Eureka, Gold Hill has not fluctuated during the week. It is quoted at at \$35 to 40, with as many buyers as sellers.

Overman has gained slowly since Monday and cannot be quoted at less than \$85. A large number of shares were sold during the week at \$30 to \$35.

Belcher, Gold Hill, has steadily advanced and cannot be quoted at less than \$40 to \$50. It is held firmly at these figures.

Caledonia Tunnel, Gold Hill, has taken a stride upward, and is in request at \$14.

Very fine specimens of ore are being taken from Massillon, at Gold Hill, which have occasioned considerable comment, and threaten of a suit with La Plata Oro.

Reese River stock is being dealt in sparingly; \$30 is offered for Masonic, Lander Ledge, and Comet and Blue Lead are saleable at variable rates.

Iowa is marketable at a shade below San Francisco figures; \$110 is offered. Madison is again finding its way into market at \$22 to 25, with little or no request at these rates.

Shamrock may be quoted at \$12 to \$15, with little demand. Birdsell is offered in small lots at \$45, but is dealt in sparingly.

For Beach & Paxton \$225 is offered for large lots, and \$350 to 400 is asked. This ground seems to have no fixed market rate. The asking and bidding prices do not approximate to within speaking distance.

Union is saleable in limited quantities at \$80. Bullion is saleable at \$42 to 45; 32 feet sold to-day at these figures.

**Volcanic Smelting Furnace.**

PERSONS DESIRING INFORMATION AS TO THE USE of a economical process of this Furnace, and its tendency to make use of the same, when supplied of superphosphate over all other means of reducing ores and separating metals from the sulphurates, can obtain all needed explanation and advice in regard to the same, and the terms of sale of rights to use the same, on application Col J. D. Stevenson or T. Ogg Shaw, or by letter to the proprietress through the Post Office of San Francisco. Drawings may be seen at the office of Col J. D. Stevenson, No. 614 Market street, or at the office of T. Ogg Shaw, in Brannan's Building, Montgomery street.

The time required for reducing ores by this Furnace is from three to eight hours, and the amount of fuel only one-tenth as much as is consumed by other processes.

The process of condensation is applied to this Furnace which will save all those portions of precious metals which usually escape in a volatile form.

The attention of all interested in the subject is requested to examine the important results obtained by this process.

Parties wishing will be allowed to erect a trial Furnace of capacity for smelting one ton of ore or more, on signing an obligation to pay the usual fee for the right to use it, should they continue to make use of the invention or a longer period than two months.

Feb 16 MRS. E. J. HALL, M.D., Proprietress.

**New Style of Lady's Buckle.**

W. BOHM, INVENTOR & PATENTEE

THE SUBSCRIBER HAVING OBTAINED LETTERS PATENT from Washington for an improvement in the construction of Ladies' Buckles, is now ready to furnish the same in every variety of style. This buckle possesses several very important improvements over any other in use.

The invention having been carefully examined at the Patent Office, has been adjudged to be a useful improvement, and Letters Patent have been granted for 17 years. It excels all other buckles in

**Usefulness, Strength and Appearance.**

The Public is respectfully invited to call and examine this Buckle at the Jewelry Establishment of

SAN FRANCISCO.

**Attention! Attention!**

A TRACT OF LAND, EMBRACING AN AREA OF 400 Acres has recently been surveyed and plotted out into lots, which are now offered for sale on reasonable terms as any ever offered by the various Homestead Associations in our city. The tract is known as the "University Mount Survey," and derives its name from the fact that the Directors of the University College have selected a site of about twenty acres in the center of the tract for their College Building and Park. This property is more beautiful than any other ever offered in this market, and its location is such that it must in the natural progress of improvement soon be in great demand for places of residence. That this property will increase in value, is as certain as the future of San Francisco.

Investments in Real Estate, it is well known, have paid as largely as any other, and insurance against risk of depreciation in value is secured by the sure and rapid increase of our population.

Invest in Real Estate, and you will find it more profitable than investing in wild-cat mining stock, or loaning money that may be paid in depreciated currency.

The prices for lots in the above tract will remain uniform until after the holidays—that is, without interest. The title to the land is perfect.

For further particulars apply to

HARVEY S. BROWN,  
No. 19 Naglee's Building.

Lithographic Maps can be seen and had at the above named office. no 13 6mo

**READ THIS!**

COAL OIL EXPLOSION.—ON SATURDAY EVENING, while Mr. Brewster was engaged in the Summer Street House in pouring coal oil from one can to another, his wife imprudently approached with a lighted candle and the oil exploded. Mrs. Brewster's arms were badly burned, as were also the husband's hands. However, he succeeded in mastering the flame, and preventing worse consequences.—[Evening Bulletin, Aug. 4.]

**50 lbs. MARINE AND  
Fire-Proof Paint,**

MANUFACTURED BY THE PACIFIC METALLURGICAL Works in this city, for Hulls and Decks of Vessels, from ground Mineral Rock contains Arsenic, Copper, Litharge and six other Minerals. When used on the Decks or Bottoms of Ships, it is equal to a coat of Stone, and quite equal to Copper, no worms will ever effect it, and cheaper than any other paint.

**DIRECTIONS:**

For Decks of Ships, use two parts Mineral Paint, one part White Lead, mix with Linseed Oil.

For Bottoms of Vessels, use one part ground sulphur three parts Mineral Paint, mix with Coal Tar and apply it hot.

For sale by all Ship Chandlers and Tradesmen, in boxes of 50 lbs. each, or by the Pacific Metallurgical Works.

**25 POUNDS FIRE-PROOF PAINT.**

When used on Roofs, Buildings, or Fences, it is equal to covering them with a coat of Stone, being perfectly Fire Proof, and costing less than any paint.

**DIRECTIONS:**

HOUSE.—Mix three parts Mineral Paint with one part white lead, thin with Linsseed oil: if a lighter color is wanted, mix less paint, more lead.

ROOF.—Five parts of Mineral Paint, one part white Lead; mix with Linsseed oil. Put it thick on a tin Roof as one coat when properly applied will last three years.

S. C. BRADSHAW, Agt.,

G. T. FOUQUE, Superintendent.

WORKS, North Beach; Office, 318 California st., San Francisco.

**WRIGHT'S PICKS.**

JOHN WRIGHT, of Sacramento, has established himself in San Francisco for the manufacture of every description of PICKS, of the best material, at reduced prices. PICK EYES of the best iron furnished in any quantity, at low rates. Orders from the country promptly attended to. N. B.—None genuine unless stamped with my name.

JOHN WRIGHT, 511 Market street,  
Opposite Battery, San Francisco.

**REMOVAL.**

OFFICE OF THE PACIFIC METALurgical Office is removed to 318 California street. Having enlarged our Works at North Beach, we are now enabled to reduce from 10 to 15 tons of Silver or Gold rock per day.

Gold and Silver ore, and Sulphuret Assayers', or Silversmiths' sweepings reduced or purchased.

COPPER ORES—Highest market rates advanced in cash, for shipments. S. C. BRADSHAW, Agent,  
318 California street, near Sansome, up stairs.

Real Estate Purchased and sold, and Loans Negotiated.

## WHEELER'S

## Amalgamating and Separating Pans.

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the said. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of trituration, and in cleaning up. By the introduction of the Separating Pan to follow the trituration this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

\*.\* These Pans may be seen in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves.  
no16-1f ZENAS WHEELER.

## PEOPLE'S

Steamship Line!  
CONNECTING  
CALIFORNIA AND NEW YORK,  
VIA NICARAGUA.

750 Miles Shorter than any other Route!

The Fast and Favorite Double Engine Steamship,

## MOSES TAYLOR,

J. H. BLETHEN.....COMMANDER,

Will be dispatched for

## San Juan del Sur,

From Mission street Wharf.  
Punctually at 9 o'clock, A. M., on

WEDNESDAY, - - - APRIL 22, 1863.

Connecting at GREYTOWN with the Splendid Steamship  
ILLINOIS.....2500 Tons.

Reduced rates of Passage and quick trips are secured by the re opening of the Nicaragua Route.

These Steamers are unsurpassed for speed, cleanliness and safety, and every effort will be made to insure the comfort of passengers

## Miners' Foundry

—AND—

## MACHINE WORKS,

First St., between Howard & Folsom,

SAN FRANCISCO.

EVERY DESCRIPTION OF IRON AND BRASS MACHINERY, the Best and Most Economical, manufactured in the state of California, will be furnished with dispatch at the Miners' Foundry and Machine Works, as:

Steam Engines and Boilers, Flower, Saw and Quartz mill machinery, Mining Pumps, Amalgamators, Retorts, Etc., Etc., Etc.

Particular attention will be given to the manufacture of Machinery in Sections, designed for places of difficult access. Various models of Quartz Crushers, Amalgamators and Water Wheels—some in operation and on exhibition.

\*.\* Parties desiring to test their ores practically, in small quantities will be afforded ample facilities, free of cost.

All parties desiring accurate and highly finished drawings and Superior Machinery, at most reasonable rates are cordially invited to call before contracting elsewhere.  
HOWLAND, ANGEL & KING.  
San Francisco, February 23, 1863.

NO. 24.

#### PRODUCTION OF COPPER IN GREAT BRITAIN.

In 1861 there were 139 mines worked for copper in England and Wales, eight in Ireland, and several in other parts of the British dominions. The entire yield of these mines, in ore, was 231,487 tons, valued at \$6,800,000, or a fraction over \$29 to the ton. The amount of fine copper realized from this ore was 15,331 tons valued at \$7,838,000. The difference between the total valuation of the ores produced and the value of the fine copper realized, should represent the costs of working and refining. This we find is but \$4 48 per ton of ore.

**COPPER YIELD OF GREAT BRITAIN AND THE UNITED STATES.**—The United States, in all probability, will next year become the largest copper producing country, in the world. The yield of copper, in Great Britain, for 1861 is set down at \$7,838,000. The value of rough copper shipped from Lake Superior in 1862 was \$4,000,000. The value of this shipment when refined will be enhanced about \$838,000, thus making the difference of yield between Great Britain and the United States, only \$3,000,000. The rapidly increasing yield of the Lake Superior mines added to what may be expected from California another year, will probably wipe out this difference and place this country ahead of England in its copper yield. According to present appearances, it is not unreasonable to conclude that it will not be many years before California will bring to market a larger amount of rough copper and copper ore than all the world besides.

**VALUE OF RAILROADS.**—We commend the following, from an English writer on the subject of railways, to the people of California:

"Railways have, when properly selected, been invariably attended with the following results: Increased Government revenue; increased value of all property; increased cultivation and produce, and expansion of manufactures; increased accommodation to all classes for intercommunication; diminished cost of all descriptions of goods to consumers, and increased consumption by accession of numbers; a measure of universal benefit without a drawback or objection, if selected and carried out under due provisions, with judgement and discretion."

A correspondent of the *Westminster Review*, speaking on the same subject, says:

"Wherever railroads are constructed—whether they cross the American Continent, and link the Atlantic and Pacific Oceans, or line the banks of the Thames, the Rhine, the Danube, and the Euphrates; traverse the burning plains of Hindostan, or the snows of Siberia—the maxim enunciated by Mr. Pease of Darlington, when railways were only experiments, on the success of which he had risked his fortune, will equally hold good, and remain unquestionable evidence of his largeness of view and soundness of judgment: 'Let the country but make the railroads and the railroads will make the country.'"

**ONE HUNDRED THOUSAND COMING!**—Captain Crawford, who commands the escort provided by the Government for the protection of the present year's Overland emigration reports, by telegraph, March 30, that 50,000 emigrants were already en route for California, and that the number for the entire season would reach 100,000.

#### ELECTRICAL PROCESS FOR AMALGAMATING GOLD AND SILVER.

For some months past, Messrs. Norton & Eddy, No. 616 Merchant St., have been quietly operating and bringing to perfection, so far as may be, what appears to be a very important improvement in the amalgamation of the precious metals, by the application thereto of the principle of electricity. The process, which has been patented, and which is known as the "Norton & Eddy Process," is simply the application of a current of electricity, generated in a battery, to the mass of pulp in the pan. Any ordinary amalgamating pan may be used, by simply placing a battery of moderate power, having one pole connected with the quick-silver and the other with the pulp, and kept in that condition so long as the process of trituration continues with any given charge of the pan. The results, as we learn from several parties who have taken rock, and tailings to these gentlemen to be treated is most astonishing. We have one result before us where a gentleman took 50 lbs. of tailings from a quartz mill, that had passed all the usual processes of amalgamation, but which under this electrical treatment returned a further yield of \$66 to the ton. The same gentleman took several other lots of rock to Messrs. Norton & Eddy, from all of which he realized like satisfactory results. He has backed up his opinion of the process by ordering its immediate application to a mill in which he is engaged near Placerville. Other gentlemen, who have had rock subjected to this process, have expressed themselves to us in like favorable terms of its results. We chronicle these results as among the passing efforts of the day to improve and simplify the process of working ores of precious metals in this State. We have no further personal opinion to express of it than the simple fact that the process appears to be advantageous, especially as it may be applied, at a trifling expense over and above, and in connection with all others, in use. It also appears to be perfectly reasonable and philosophical. It is now an almost universal admission that electricity if not almost the sole agent, is at least a most important one in the production of most mineral deposits. Its application to them in connection with the arts, as in electrotyping, etc., is now universal and still most wonderful in its effects. If it exerts such a powerful influence over these minerals when minutely divided in the shop or laboratory, why may not the same principle be applied on a larger scale, in the quartz mill, and in collecting those minute particles which have been separated or but partially collected in the great laboratory of Nature? The experiments of Messrs. Eddy & Norton seem to answer this question most definitely. We would recommend persons interested to call and examine this process for themselves, at No. 616 Merchant St., in this city.

We understand that this process has been tried most successfully upon concentrated sulphurets. A lot of sulphurets supposed to be only of ordinary value, were recently subjected to the process, and the result showed a yield of \$2000 to the ton. The quantity worked was an ordinary charge for the pan. In addition to the introduction of this process to a mill in Placerville, we understand it will be more extensively tried in one of the principal mills in Washoe, ar-

rangements for the same having already been consummated. We shall be informed of the results at these mills as soon as they can be obtained and shall promptly communicate them to our readers.

**COPPER.**—We were shown on Saturday some very rich specimens of copper ore, taken from a vein lately opened at Rouse's Ranch near Grass Valley. The specimens were taken out at a depth of twenty-five feet below the surface, and some of them we should think contain at least eighty per cent of copper. The ledge was worked some years ago for gold, but failing to pay was abandoned. The ledge was relocated last fall by Mr. John Armstrong, as the "Excelsior Sulphuret Mine" and a company has recently been organized to work the same, under the title of the "Nevada Copper Mining Company."

**THE NAPOLEON COPPER MINE.**—This mine has recently been placed under the supervision of Mr. Joseph Powning, a gentleman who has had much experience as a copper miner, both in Cornwall and at Lake Superior. Mr. P. has also become quite largely interested in its stock. We understand that the workings at the mine are to be very materially modified and improved, a step which cannot fail to operate most beneficially upon its future. Some very rich rock has recently been struck, with good indications for continuance.

**THE LADY BRYAN.**—Mr. Owens, the Superintendent, yesterday showed us a magnificent specimen of ore from the Lady Bryan ledge. This is a ledge twelve feet in width, running north and south, with well defined walls on the east and west sides of it. The rich, or what is termed the "pay streak" in the ledge, is twelve inches wide, with black sulphurets running all through it. A shaft, now forty-three feet deep, is being sunk down along the hanging wall of the ledge. The water is already flowing into the shaft quite freely. [*Virginia City Union, April 4th.*]

**THE COMSTOCK CASE.**—In the case of the Comstock vs. Pride of the West, tried in the Third District Court, at Dayton, on Wednesday week, the jury rendered a verdict in favor of defendants. The Comstock Company will appeal the case. The suit was the third trial of the same cause, and the first in which the jury went on the ground.

**WHAT IS THOUGHT?** A fountain from which flows all good and evil intentions; a mental fluid, electrical in the force and rapidity of its movements, silently flowing unseen within its own secret avenues; yet it is the controlling power of all animated matter, and the chief mainspring of all our actions.

**WHAT IS KNOWLEDGE?** A key that unravels all mysteries, and which unlocks the entrance, and discovers new, unseen and untrodden paths in the hitherto unexplored fields of science and literature.

We understand an evening paper is about to be started in Virginia City.

## THE HUMBOLDT MINES.

The following letter, written for, and published in the *Mountain Messenger*, of the 15th of November last, contains the fullest and most complete account of the mining operations in Humboldt, which we have seen. Those of our readers who desire to post themselves with regard to this new mining region will do well to read it carefully. The letter was written by Mr. Wm. A. Holcomb, one of the earliest adventurers into that distant region, and now Treasurer of the county which has been organized there, and a most intelligent and experienced miner. He is now in this city. We have had the pleasure of several interviews with him, and he has assured us that he will hereafter keep our readers thoroughly informed with regard to mining matters in that locality, by contributing to the MINING AND SCIENTIFIC PRESS.

EDITOR MOUNTAIN MESSENGER:—Not having written you for some time past, you have perhaps come to the conclusion that I have become disgusted with silver-land, have taken up my blankets and skedaddled out of the country. In order to convince you that such is not the case I drop you a few lines, and give you the result of my observations while on a recent trip around the mountains.

After securely bolting and barring all the doors and windows of my stately mansion, I took up my line of march for a visit to some of our mining districts, which I had often heard of but never seen. Traveling along the low foot-hills, covered with sage brush and greasewood, with here and there a scrub cedar, I pursued my course, crossing Coyote and Star Creeks, leaving Star City to my left, and finally reached the flourishing village of Santa Clara, where I found my friend A. J. Simons, (one of Humboldt's Representatives in the Territorial Legislature,) with his feet elevated considerable higher than his head, and dividing his time between Blackstone and a kettle of beans which he was cooking over a slow fire, evidently expecting the arrival of some hungry miner. I rather think he came to the conclusion, before I finished my dinner, that the aforesaid hungry individual had arrived.

Santa Clara is situated about fourteen miles north of Unionville, is a pleasant location for a town, has a very enterprising and industrious population, and some of the richest silver ledges in the range. Among the richest of them are the Magna Charta, Butte, Wyoming, Tehama, Kentucky, High Star, Accident No's. 1 and 2, Siskiyou, Last Chance, Yellow Jacket, and Twilight. The Magna Charta tunnel is in 240 feet, is now in the casing rock and within a few feet of the ledge. They have passed through several small veins or spurs which show very rich mineral. The tunnel is being run by two companies, the Lager Beer and Sparkling Wave, at right angles with the ledge. Two companies are located on the Butte ledge—the Tehama and Cherokee. Both companies have sunk shafts on their claims and have taken out some very rich rock. The Cherokee Co. are now running a tunnel, under the supervision of Adam Folk, to open the ledge at a depth of 200 feet. This company intend opening their claims this winter and erecting a mill early in the Spring. The Tehama Co. will take out quartz through their shaft for the present. Eight tons of this quartz was worked by the Cherokee Co. during the Summer, with an arrastra, without the silver process, and yielded a little upward of \$250 per ton, which has established the richness of the ledge beyond a doubt. This company recently sold 108 feet of their ledge for \$100 per foot. The ledge was discovered in September, 1861, by Jack Powers and A. J. Simons. The Wyoming tunnel is now in a little over one hundred feet and the work still progressing. The ledge has been thoroughly prospected from the surface, by a shaft, and the quartz has proved rich. The Tehama, Highton, Kentucky, and several other ledges in this district, are being prospected with tunnels, and promise equally well. The population of Santa Clara is about one hundred. There are four families in the place, and another is expected to arrive shortly.

After remaining over night in Santa Clara, and enjoying the hospitality of friend Simons, I crossed over the mountain, a distance of four miles, to Prince Royal, or Lassenville, which is a flourishing little mining camp, situated in a deep cañon on the west side of the mountain, and near the upper end of the range. There are about forty persons in

the district, and two families. This district has many rich ledges, the most noted of which are the Newton, King, Webster, Sallust, Coulthurst, Davis, Esop, Socrates, Keystone, Mark Anthony, Yankee Blade, Lassen and Prince Royal, which are all being prospected by tunnels. The Newton tunnel is in one hundred feet, is now very near the ledge, and has been cut through several small veins which are rich. The King tunnel is being run on the opposite side of the hill from the Newton, intending to intersect at the centre of the ridge. These tunnels, when completed, will be 800 feet in length and will open six ledges—the Newton, Sallust and Coulthurst on the east side, and Ring, Webster and Davis on the west. A tunnel is being run into Esop Hill, which will open three ledges—the Esop, Mark Anthony and Socrates. This tunnel is now in 85 feet. The Keystone tunnel is in 65 feet, has about 130 feet further to run, and when completed it will open three ledges—the Keystone, Yankee Blade and Lassen. The Prince Royal tunnel is in 65 feet and is very near the ledge. All of these ledges will be opened this coming winter, and Prince Royal District will be able to furnish quartz enough to keep several mills running next summer. The Louis Napoleon, Lincoln, Fort Pitt, Pennsylvania, Honey and Washington are all considered, first class ledges. Arrangements have been made to have a twelve stamp steam mill erected in this place early in the Spring. I must give Prince Royal District the credit of having done more toward developing the mines, in proportion to the number of inhabitants, than any other district in the range. I remained one day in Prince Royal District, and was well pleased with the indications.

After leaving Prince Royal, and traveling down the mountain four miles, in a westerly direction, I arrived at the oldest settled village in these mines—Humboldt City. This place is pleasantly situated, contains about sixty houses—some of which are fine ones—has a population of about one hundred and fifty, and seven families. The town does not appear to be very lively at present, as many of the miners have gone over to California to lay in their supplies for the winter. The ledges of this district are large, well defined, and full of mineral. Among the richest of them are the Cuba, Crittenden, Canada, Huntington, Louisiana, Humboldt, Cape Cod, Winnemucca, Melrose, Constant, Santa Anna, Mississippi, Florida, California and Cutler. The Cuba tunnel is now in one hundred and seventy-five feet; they are on the ledge, and taking out very rich rock. The Winnemucca is in 50 feet, and this company have just struck the ledge, and struck it rich. The Crittenden is in seventy-five feet, and the company have about twenty feet further to run. They have run through a spur of this ledge, two feet wide, which prospects very rich. The Canada has a shaft, 25 feet deep, sunk on the ledge. The Huntington tunnel is in 60 feet, and there are about 20 feet further to run. The Louisiana tunnel is in 125 feet. This company have not struck the ledge with the tunnel, but are taking out good rock through two shafts, which are now down 40 feet on the ledge. The Ed. Payne Co. have a shaft, 55 feet deep, sunk on the ledge. They have had to suspend the sinking of their shaft on account of water, and are going to commence a drain tunnel soon. The California Company have their tunnel in upward of 100 feet, and have about 25 feet further to run. Several other companies are running tunnels to open their ledges. Judge Horrell has the machinery for a steam mill on the road for this place. The mill is to be erected immediately. A company is about being organized for the purpose of conveying the water from Humboldt River in a canal 13 feet wide and 5 feet deep. The canal is to be  $2\frac{3}{4}$  miles in length, and a fall of 21 feet can be attained in that distance. This project, if carried out, will furnish an immense water power, affording fine facilities for working the ledges in this and Prince Royal District. I remained two days in Humboldt City, visited several of the tunnels, examined the ledges, and I am well satisfied as to their richness.

After leaving Humboldt City, I continued my course down the west side of the mountain for eight miles, journeying along the old emigrant road, where I traveled several years ago, when I was a poor, god-forsaken, barefoot emigrant, chock full of alkali. Little did I then think that my fortune and the fortunes of thousands, lay buried beneath the lofty mountain to my left. After crossing El Dorado and Spring Cañons, I commenced ascending the mountain. After pulling and tugging, sweating, panting and climbing for two

hours and a half, I reached the summit, where I had a fine view of Unionville and the surrounding country. I stopped on the summit for a short time, to rest and refresh myself, and then commenced descending. The descent is very steep, but I managed to make the trip down the mountain in much less time than it had taken me to ascend, and I soon found myself at "my own loved home," tired, foot-sore and hungry.

I regret not having had time to visit Star City, but I every day hear favorable accounts from this district. Star District has as many good ledges as any other district in the range, and has excellent water privileges, which is no small item in this country. Considerable improvement is going on in Star City in the way of building and opening ledges. The principal ledges in Star District are the Sheba, Franklin, Mammoth, Almo, San Barnard, Yankee, Slabtown, Arch, Mountain top Pines, Haviland and Jeff. Davis. Most of these ledges are being thoroughly prospected with tunnels, and with very flattering results. The Sheba, Franklin, Mammoth, Yankee, and several other companies, are working on their ledges and taking out large quantities of rich rock. Hoonfray's Mill is now in running order, and you may soon look for glorious accounts from Star.

Considerable work is being done in Indian, American, Sacramento, and Echo Districts, though not so much as in the other districts that I have mentioned; but all of them have very rich ledges, which, doubtless, will some day make millionaires of their owners. The Moonlight ledge, in the Indian District, is one of the richest in the range, and is now being successfully worked.

Last, though not least, I mention Buena Vista District, which has a large number of valuable ledges. The National, Alba Nueva, Downey, Comet, Empire, Mars, Lander, Golden Fleece, Eagle, Chameleon, Congress, Tom Moore, Jackson, Buckeye, Blue Bell, California, Keystone, St. Louis, Mary Ann, Mary Bell, Peru, Chile, Cass and Independence, all rank among first class ledges. The National, Alba Nueva, and Mars Companies have taken out a great many tons of quartz from ledges. The Peru, Eagle, Congress, Jackson, Buckeye, Keystone, Empire, and several other companies, are working on their ledges. The Adventurers' Company, on the Chameleon ledge, are going to open their claims this winter. The proprietors expect, when their claims are opened, to take out some of the richest rock ever found in the Territory.

Unionville is improving rapidly. It now has a population of about four hundred and fifty, about thirty families, a large number of fine buildings, and already has quite the appearance of a city. Fall & Co's mill will soon be in running order. We have a large school-house nearly completed, which will answer both for a school-house and a church. Its cost is about \$1,500, which was raised by contribution of our citizens.

A good many real and sham capitalists have visited our mines during the Summer and Fall. It is a difficult matter to distinguish the real from the sham. They are all known by their long linen coats, and it is generally supposed that he who wears the longest coat has the heaviest purse. It would astonish you to see what an affection some of the sharpers (who have feet to sell) have for the long coated gentry. But long coat tails are about played out, as some of our boys, in order to have a little fun of their own, have commenced putting on the long coats. Many of the aforesaid pretended capitalists are not on the buy, but are very anxious to have feet in good ledges given to them; and they are willing to pay for said feet by giving tone to the ledges they may be interested in. This dodge isn't exactly the thing, for, as a friend of mine very properly remarks, the miners have lived too long on sage brush and bunch grass, to dispose of their rich ledges in any such a manner. A party of San Francisco bloods—men of capital I am told—recently visited our mines, remained a day or two, and returned to San Francisco thoroughly disgusted with the country, pronounced the mines a complete humbug, and advised their friends not to invest in Humboldt stock. Now, I am informed by reliable parties that these heavy capitalists did not visit a single ledge, and no one could make them believe that there were any silver ledges here. Some of them inquired for timber and were told that there was plenty of it on the range of mountains east of this place; but they, like doubting Thomas, would not believe. You can see by the statement I have made, (and I am willing to be sworn as to its correctness,) that a very large number of ledges will soon be opened. Then we shall be under no necessity of seeking capitalists; they must seek us, and they will find us when they come down with the cash. We have quit running on shape.

The miners of Humboldt county are deserving of a great deal of credit for their energy and perseverance in developing so extensive a mineral country as this. Situated as they were without means, commanding scarcely any capital beyond their own labor, and being in a country where provisions of all kinds and mining tools were held at high figures, they have accomplished as much or more than any equal number of men ever did accomplish in the same length of time, and under such adverse circumstances. This may not be the opinion of some, who have not taken the trouble to investigate the matter but it is the opinion of

UNIONVILLE, N. T.

QUARTZ.

SAN FRANCISCO MINING NOTICES.

ASSESSMENTS LEVIED.

Assessments upon Mining Stocks have been levied as follows:—

Garabaldi.—Assessment of \$1 per share, levied March 1st.

Sutro.—Assessment of \$1 per share, levied Feb. 23, payable March 23.

Silver Quartz Mill Co.—Assessment of 5 percent, levied Feb. 23, payable March 28.

Helvetia.—Assessment of 25 cts. per share, levied Feb. 7, payable March 10.

Zouave.—Assessment of \$1 levied Feb. 22, payable March 10.

Rogers.—Assessment of \$5 per share levied Feb. 4, payable March 15.

Sau Wright.—Assessment of 50 cts. per share levied March, payable immediately, delinquents to be sold Apr. 2.

Napoleon (copper).—Assessments of \$3 per share levied Apr. 3, payable in 30 days.

Golden Age.—Assessment of one dollar per share levied Feb. 24, payable March 26.

Washoe Gold & Silver.—An assessment of 2 per cent. capital stock was levied Feb. 16, payable Apr. 1.

Rhodes' Diggings.—Assessment of 25 cts. per share levied Feb. 26, payable March 5.

Texas Co., at a Meeting held Feb. 14, levied an assessment of one dollar per share, payable to the Secretary in Virginia City.

Santa Rosa Co.—February assessment of 20 cents per share are now due and payable.

Madison Co.—An assessment, two dollars per share, was levied Feb. 17, payable immediately, at Office, 600 Merchant St.

Union Co.—An assessment of one dollar per share was levied February 16, payable on or before March 25.

Pena Co.—An assessment of \$3 per share was levied Feb. 5, one half payable March 1, balance April 15.

Kossuth Co., Devil's Gate District.—An assessment of 10 cts. per share was levied Feb. 7.

Constitution Company levied an assessment of 25 cts. per share, payable immediately.

La Plata Oro Co. levied an assessment of five dollars per share, Feb. 9, payable at Office of the Secretary in Virginia City.

La Plata Co. levied an assessment of 50 cts. per share Feb. 2nd, payable at Office of the President.

Alamo Co. levied an assessment of 50 cts. per share, Feb. 9, payable on or before March 20, at 115 Cal. Street San Francisco, or at office in Carson City.

Packer Co. levied an assessment of 25 cts. per share, Feb. 11, payable immediately at 608 Merchant St.

Tawley Co. levied an assessment of one dollar per share, Feb. 9, payable on or before March 12, to Superintendent at the mine, or Secretary at Office.

State Range Co. levied an assessment of 50 cts. per share, Feb. 4, payable, March 15.

Moss G. & S. M. Co.—An assessment of 50 cents per share was levied Jan. 27, payable at 428, Montgomery St., to the Superintendent at the mine.

White Cloud G. & S. M. Co. levied an assessment of 50 cts. per share, Jan. 27, payable to the Secretary, at 428, Montgomery St.

El Dorado G. & S. M. Co.—An assessment of One Dollar per share was levied Jan. 23, payable to the Sec. or to Supt.

Baudaloupe S. M. Co.—An assessment of \$30 per share was levied, payable on or before March 1st.

El Tesora Mining Co.—An assessment of \$1½ was levied Jan. 27, payable at office on or before Feb. 27.

Polar Star G. & S. M. Co. levied an assessment of 50 cents per share, February 4th, payable on or before the 4th of March, at the Office in this city or the Superintendent at the mine in Aurora, (Esmeralda.)

Dios Padre G. & S. M. Co. levied an assessment of 3 dollars per share, Jan. 31, payable in 30 days, also an assessment of 2 dollars per share, payable in 60 days, at office 502 Montgomery street.

Beckwith G. & S. Mining Co.—An assessment of 25 cts. per share was levied Jan. 24, payable immediately.

Sonora Mining Co.—An assessment of 25 cents per share was levied Jan 23, payable immediately.

Overman Mining Co.—25 cents per foot, Jan. 29, payable in ten days.

Chas. Caney Mining Co.—50 cents per share, Jan. 21, payable on or before Feb. 20th.

Sierra S. M. Co. An Assessment of \$2½ was levied Jan. 22—payable immediately, at Office 575 Mission St.

Mount David-on Co.—An Assessment of 50 cents per Share was levied, Jan. 23, payable on or before March 1st, at Office 47 Montgomery Block.

Admiral.—Fifty cents per share, payable at No. 4 Armory Hall, San Francisco, or to the Superintendent at the Mine.

Hattie G. & S. M. Co.—Thirty cents per share, levied Jan. 31, payable at Office in San Francisco, or at the Mine.

Hale & Noreoss.—Assessment of Ten Dollars per Share, levied Jan. 31—payable at the Office in this city, or to John Skae, at the Mine, on or before Feb. 25.

Minna Prieta S. M. Co.—An Assessment of Five Dollars per Share was levied, Jan. 31, payable on or before March 5th—at Office, cor. Montgomery & Jackson Sts.

GENERAL NOTICES.

Yellow Jacket.—Corporate Deed now ready for signature at office of H. G. Maynard, Gold Hill, N. T.

Jenny Lind (Esmeralda).—Owners of ground in this lot are requestes to call and sign deed of trust at 608 Merchans St.

Mount Hope Co.—Persons claiming stock are requested to present title papers for examination till March 16.

U. S. Mining Co.—All persons claiming stock are requested to present title papers for examination at Nos. 7 & 8 Government House.

Caution.—D. M. Tyrell warns persons against purchasing a certain 10 feet of ground in the Wellington Co., standing in the name of J. B. Magee—also 20 feet, standing in name of W. Williams. (See Territorial Enterprise.)

Ashland Co.—L. A. Gould, in the name of the Moss Co. notifies the Ashland Co. that their westerly drift has cut the Lamb ledge, in the Moss Co.'s ground, from which the Ashland Co. is forbidden to extract any valuable metals.

Coso Silver Mining Co.—The Office of this Company has been removed from the Stevenson House to Nos. 11 and 13 Court Block, No. 636 Clay street between Montgomery and Kearny. Entrance on both Clay and Merchant streets.

Mining and Scientific Press.

The MINING AND SCIENTIFIC PRESS is published at the Exchange Building, Room 27, corner of Battery and Washington streets San Francisco, Cal. at FIFTY CENTS per month, or \$4 per annum, in advance.

C. W. M. SMITH and W. B. EWER, - ; - - - Proprietors.

Engravings, Electrotypes, etc.

We execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEREOGRAPHY and ELECTROTYPING. Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing. Job Work executed with dispatch at low rates. PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

To Printers.

AN INTEREST in one of the most flourishing and best paying Newspaper Offices in the mountains is offered for sale on easy terms. A rare opportunity is hereby presented to any printer desirous of establishing himself in a good business in one of the healthiest, most thriving and delightful mountain towns in the state. For further information enquire at this office.

SUBSCRIBE.—Are you a miner and not a subscriber to the MINING AND SCIENTIFIC PRESS? If so, you are an annual loser of many times the price of a year's subscription, particularly if you are engaged in quartz mining. The same amount of practical information, important to miners and mechanics, which is contained in a volume of the PRESS, cannot be bought from the shelves of any bookstore in the country for the price of several year's subscription. Do you ever send a paper to the "Old Folks at Home?" If so, and you desire to send important information and valuable reading matter, you can find no paper that will be read with so much eagerness by them, or one that will convey to them so full an account of the real industry of the country as the MINING AND SCIENTIFIC PRESS. We invite all to send us their names and *four dollars, or two dollars* for six months, and become patrons of the only mining paper printed on the Pacific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examination, and with the hope that it may so for meet with their approval as to warrant their subscribing for it at once. It is not our usual custom to receive a subscriber for less than six months; but inasmuch as we are anxious to introduce the paper where it is not now known, we will, for the present, send the PRESS for three months even, on the receipt of one dollar, in coin or stamps. It is our belief that no one will wish to discontinue the paper after being a constant reader of it for even that short period.

THE SWEZEY Co., Gold Hill, give notice that Baltic Company have wrongfully claimed and worked their ground since July, 1860.

THE CHIMNEY ROCK Co., lying next west of the Virginia Co. claims have notified the Hazel Green, Tingley and Bach & Paxton Companies that they are trespassing upon the Chimney Rock Co.'s ground.

MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

THIRD YEAR! VOLUME VI.—NEW SERIES!

A new volume of this extensively circulated paper commenced Sept. 11, 1862. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to last purpose, and of everything generally that may be of service to the Miner.

The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects, Millwrights and Farmers!

This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

Terms.

To mail subscribers:—Four Dollars per annum.

Club Rates.

Five Copies for Six Months, \$8.  
Ten Copies for Six Months, \$16.  
Ten Copies for Twelve Months, \$30.  
Fifteen Copies for Twelve Months, \$44.  
Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 80. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

The Great Success of this Century, as an Aid to Practical Medicine.

The Mysterious Problem of Material Nature, Electricity! Made Subservient for the Cure of all Nervous and Spinal Diseases

THAT THIS PRINCIPLE, successfully applied to diseased states of the system, is to prove the great sought-for necessity, long wanting by physicians to aid their medicines in overcoming organic and functional derangements of the human body. It is a part of the great principle of vitality known as nervous influence and necessarily must have much to do in obviating diseased action.

Too Much Cannot Be Said

In its praise; for it is highly probable that in health there is an exact equilibrium of the ELECTRIC principle; and should this secret and hidden equipoise of health be broken or lowered—should the body be negatively electrified when it should be positively charged—is not the current broken, and is there not a war of forces going on in our system? This needs correcting, and in order that the tissues of the body should be susceptible to remedial agents we must first restore and

Awaken the Magnetic Life Within Us.

The spinal and sympathetic nerve systems. Believing as I do most firmly in this great magnetic or electrical intensity of the earth, with its influences upon our bodies in health and disease, I am led to take advantage of the press, through which to awaken attention to the subject, that good may come to all.

## TO MINERS AND PROSPECTORS.

In view of the frequent accidental discoveries of valuable mineral deposits, other than gold, in almost every section of the State, which have of late been made, it is but reasonable to suppose that prospecting even in California, has but just commenced. The simplest and most universal of all metaliferous deposits is gold. It rarely occurs in any other form than that of "free gold" which is readily discernable to the naked eye. An examination of any rock or earth for gold is an extremely simple process. If its presence is suspected in alluvium, the simple washing of that alluvium in a pan is an invariable test. If in rock of any description; that rock pounded fine in a mortar and washed, in the same manner as alluvium, will usually expose its gold to the naked eye, if there is any there in paying quantity. The only exceptions, are where the gold is contained in iron pyrites, or copper pyrites containing also iron. In either of the two latter cases the presence of gold may be readily ascertained by placing the pyrites in any suitable vessel and keeping the contents at a moderate heat for from four to six hours, with frequent stirrings, by which means the sulphur will be evaporated, and the copper, if any is present, changed to a dull red color, and the gold retaining its natural appearance, on subjecting the whole to the usual panning process, may be readily seen by the naked eye.

Not so with other metals. Silver, copper, zinc, nickel, and many others appear in such a great variety of metalliferous forms as generally to defy all but the most practical and scientific eye. No description of these ores can be written which will afford any very important aid to the inexperienced in making explorations. After reading descriptions, however, and carefully examining the specimens described, the explorer may go out and search with some degree of confidence and intelligence. A study of the characteristics of the sulphuret ores alone, would lead an explorer to pass over, entirely unnoticed, the richest varieties of the ores known as Chlorides or Horn Silver, which, from the facility with which they may be worked, and their usual richness, are generally considered the most valuable of silver ores. There is much reason to believe that this variety of silver ore will be extensively found in all the volcanic regions of this State. So with many other ores.

Considering the great difficulty, in the present lack of cabinet collections, and other means of instruction, to acquire a practical mineralogical and geological education in this State, and desirous to aid, to our fullest capacity, the development of our mineral resources, we hereby make the offer to miners, prospectors and all others, who in their travels or explorations may come across specimens having the appearance of rarity or value, to carefully examine and pronounce upon the same, free of charge, as to their characteristics, value, etc., whenever any such specimens are brought or sent to this office free of cost to us. We have already been called upon in many such cases, and we shall at all times be willing to give our attention to any such requests which may be presented to us.

Our object is to furnish the miners of California with every class of information which shall be valuable to them in the progress of their calling and in the development of the mineral resources of the State, and we know of no way in which we can devote a portion of our time more to the interests of miners than in the manner here proposed. The only equivalent we ask is that they shall do what they reasonably can to sustain and improve the paper devoted exclusively to their interests.

In carrying out the plan we propose, every miner and prospector should be at all times on the lookout for any new mineral. The ordinary rocks with which the miner meets in his travels and labor, and which possess no mineral value are usually well known. Whenever a rock presents any unusual appearance in conformation, color or other characteristic, attention should at once be given to it. There is scarcely a piece of quartz or rock of a quartzose nature, which presents any uncommon appearance in texture or color that has not been thus modified by the deposit or intrusion of some mineral substance. If such rock is found upon or near a vein of quartz it should be carefully examined "in place," and if the cause of its peculiarity is not evident and readily seen, it should not be passed carelessly by. There may be value in it, although the gold may not shine there. We shall commence in our next issue a series of articles de-

scribing as accurately and as intelligibly as possible all the ordinary mineral substances which may be likely to come under the notice of the California prospector; and we have the promise also, at an early day—probably within a week or two—of a series of articles under the head of "THE MINER'S LABORATORY," which will be prepared especially for this paper by one of the most skillful metallurgists on this coast, and which will be found of great value to the mining public.

**A USEFUL INVENTION.**—By invitation of the inventor, Mr. ALFRED E. FRICK, one of the popular conductors of the Market Street Railroad, we recently examined, at his residence, near the Mission, a working model of a most useful and ingenious machine, which he has just perfected, and for which he has taken the necessary steps to secure a patent. This invention may be called a "packing machine," designed more especially for the putting up of small packages of coffee, spices, mustard, etc. It is most ingeniously constructed, compact and simple, yet so perfect and effective, that with it two boys can perform the labor of six men by the old hand process—and do it much better.

This machine is especially valuable for packing coffee for the reason that the pressure produced operates to so compress the grains of coffee (ground) as to almost entirely exclude the air from the package and thus preserve the aroma, which is the strength and real excellence of coffee. The packages, when filled, instead of being loosely tied with strings, are hermetically—or nearly so—sealed with paste. By this means, the bouquet of the coffee, instead of escaping through the folds of the paper, is preserved until the package is opened for use.

It is difficult to give a very intelligible description of the machine, without an illustration, but the reader may perhaps form some idea of it from the following: The coffee or other material to be packed is placed in a hopper from which it is distributed, through valves into three or more boxes, the exact size and shape of the package to be made, and into which the paper has first been placed. After the material has passed through the valves, they are closed and made to operate as levers or stamps; the boxes being placed on a table or platten below, and by a simple movement made to move up against them. The coffee, or other material is thus closely and neatly compressed. The inventor claims for his invention the following qualities: 1, economy of labor; 2, economy of packing material; 3, superiority of the article packed over the same quality of a similar article packed by the hand process.

**RAIN.**—Two inches of rain fell in San Francisco during the month of March, making the entire amount for the season thus far 11.78 inches. Last season the entire fall of rain here equalled 47.75 inches.

**SNOW.**—The amount of snow which fell this winter, up to March 1st, at Hermit's Valley, on the Big Tree road, near the summit, was 14 feet 7 inches. The amount that fell during the corresponding time last winter, was 52 feet.

**WHAT IT COSTS.**—It costs twenty dollars a ton for transportation of merchandise per hundred miles on an ordinary road, two dollars on a railroad, and twenty cents on the ocean, for the same distance.

**HALLIDIE & Co.**, of this city, have entered into a contract to erect a wire suspension bridge across the Frazer, about a mile from Chapman's Bar. It will be the first work of the kind constructed in British Columbia.

**SINGULAR.**—There is a plant growing in the springs of Iceland, which not only flowers but bears seed, in water hot enough to boil an egg. So says Ross Browne in one of his letters to Harper's Magazine.

**THE Donaghmore furnace**, in Lebanon, Col. Hammond, manager, has been in continued blast for four years and twenty-four days. Throughout that time it has averaged 119¾ tons of iron per week, and has consumed but 1¾ tons of coal in the production of a ton of iron. The Donaghmore is a twelve-foot furnace.

**PAINT TO ENDURE.**—It is said that boiling coal tar with slacked lime, will make a shining surface on woodwork, and walls of any kind, which is as imperishable as stone, and therefore valuable for out-houses, &c.

## NEW DISCOVERIES, ETC., IN THE VICINITY OF PLACERVILLE.

In November last we made mention of some recent gold discoveries near Poverty Point, in the vicinity of Placerville. The lapse of time since then has proved, most conclusively, that both Poverty Point and Poverty Bar, as applied to that locality, are misnomers—for this vicinity has now proved to be one of most extraordinary richness.

The New El Dorado Co., of which we made mention has since put up a small steam mill upon their vein, but were permitted to run it only long enough to develop a ledge of extraordinary richness, when an injunction was served upon their further operations, by another party who claimed priority of title. This suit is not yet finally decided, although the El Dorado Co. are confident of winning.

This mill has now been leased by Mr. A. F. Mitchel, of this city, who is quite extensively interested in valuable "feet" in that vicinity. Mr. M. will soon start up the mill, with rock from the claim adjoining the El Dorado. He will employ, as an adjunct to the stamps, a new process, which has recently been patented and perfected in this city, and which will be known as the "Norton & Eddy Electrical Process." This process is fully described, elsewhere in our columns to-day.

The New York Company, on the same lead, have just started a water-mill with the capacity for crushing 10 tons per day. They have sunk a shaft 45 feet deep and run a tunnel 60 feet, and are now taking out very rich rock. On the extreme northerly end of the El Dorado, a company has struck the continuation of that vein in a 14 foot shaft which shows very rich rock, carrying coarse gold.

A new lead has also been discovered, running parallel to the New York, and located by the American Co. An average lot of 480 lbs. of rock from this ledge worked in this city by the Norton and Eddy Process, yielded at the rate of \$78.85 per ton, carrying about six per cent. of silver. All of the rock in this vicinity yielded a small percentage of that metal, in connection with the gold.

A somewhat remarkable, yet most fortunate accident occurred, about three weeks since in the tunnel of the Poverty Point mill. A large slide occurred, which nearly destroyed the tunnel, and as it had not been paying anything of consequence for some time the company were about abandoning their ground, when, upon a more careful examination of the slide it was discovered that an entirely new vein had been exposed parallel to the old one, and only six feet distant from it. On further exploration this was found to be the true vein, about six feet thick. The company has now started in anew, with most encouraging promise, and high hopes of future success. A new ledge has also been recently opened near Chili Bar, in this vicinity, which presents every indication of proving rich. It is 15 feet thick. The company have taken up a water power upon which they propose erecting their mill.

The Pacific Quartz mill, which is located directly in the town of Placerville, has recently thrown away the arrastras, which they have heretofore used, and substituted in the stead pans—of whose patent we have not learned. We understand that the change has proved most satisfactory—their rock yielding by the new process nearly 50 per cent. more than they have heretofore obtained.

**A MINING ITEM FOR SMOKERS.**—Some five or six weeks since, ten individuals, belonging to the Dashaway Association of this city, all inveterate smokers, agreed to abstain from their favorite weed for a period of six months, and invest the usual expenditure for that luxury, in a common fund for their mutual benefit. In about one month this fund reached the amount of \$200. It was then resolved to invest that sum in mining stock. The "feet" were accordingly purchased, and one evening last week the announcement was made that their "stock" had advanced to \$500 in value.

The above item furnishes a striking evidence of the expensiveness of the habitual use of tobacco, and the great advantage of a judicious investment in mining stock.

**HUMBOLDT SALT.**—It has been ascertained, says the Virginia Union, that beneath the stratum of loose salt lately discovered in the Humboldt district, N. T., there is a bed of crystalized salt, ten feet thick. Pieces of this rock are is transparent and white as clean ice.

## GENERAL MINING STOCK REPORT.

## REMARKS.

A greater firmness and better feeling has pervaded the mining market during the past week than ever before. The transactions have also been quite as heavy and numerous as during any previous week. Both speculation and a desire for personal investment have influenced movements, and a material advance in stocks has been the general result. As an evidence of increased activity in the market and the growing interest which capitalists are taking therein, we may instance the significant fact that the Exchange Board have recently increased the admission fee from \$500 to 1000 without producing any perceptible decrease in the number of applicants.

In Ophir but little has been done, one transaction only having taken place, in which 5 feet changed hands at \$2400 br. 30 days. This company paid a dividend of \$48 per foot, on Wednesday last. They have just made the last payment of \$25,000 on account of the Virginia purchase, and now, being out of debt, and the mine in good working order, it may be presumed that their next dividend will come up to former figures, with a material advance in their stock.

Gould & Curry. The marvelously rich strike recently made in this company's mine has created an unusual demand for its stock during the week. The market for the week opened at \$3200 and steadily advanced to a closing price of \$3650 cash and \$3900 on 90 days. The developments alluded to were made in a new shaft 15 feet below the present working, from which was taken about half a ton of native silver, estimated to be worth some \$10,000! Further important developments are looked for by holders of stock, with so much confidence, that it is difficult at this writing to find sellers at any reasonable price.

Savage has also come in for an unusual share of favor. The report during the early part of the week that they had "struck it rich" at the mine, and the effect to advance the price of shares some \$400 over quotations of last week. This stock may be quoted now at \$1700 at 1800.

Hale & Norcross. In consequence of the happy hit in the Savage, the Hale & Norcross, which is the next location on the same ledge, was considerably enquired for, but without any very material advance over previous quotations.

The Daney has been quite active during the week, and is much sought after. About 1600 shares (400 ft.) have changed hands at rates materially advanced over previous quotations. The new mill of this company has gone into operation. The result of the first week's crushing was \$10,000 from 150 tons of rock. The second "clean up" has just been reported, with a very material improvement in yield. "90 tons yielding \$21,000" is reported. A fine streak of ore "spotted" with native silver, is said to have been struck within a few days at the mine. The Daney bids fair to prove a very valuable mine. The flattering results above noted, are attracting much attention to it.

ESMERALDA MINES.—The especial interest attached to the recent important developments at Virginia City, appear, for the time being, to have drawn off attention somewhat from the Esmeralda mines. From the local papers there, however, and from private information we learn that most active efforts are now being made to properly develop the mineral resources of that locality, as well as the region still below, on the Eastern Slope.

We append our usual record of transactions, and reports of interior Mining Markets.]

## WASHOE STOCK REMARKS.

For the week ending April 4th, 1863.

[COMPILED FROM THE DAILY TERRITORIAL ENTERPRISE.]

The business of the past week foots up somewhat less, in the aggregate than the transactions of the last, but a fair amount of dealing is reported. Although considerable fluctuation has occurred, the general tendency of stocks is upward, and the market gives promise of continued improvement.

Burning Moscow is still fluctuating, and may be quoted at \$130 at 140. Sacramento has declined somewhat during the week, and may be quoted to-day at \$60 at 62½.

Utah has advanced \$10 and is selling at \$52 and \$55. Work is about being commenced on the mine.

Allen is maintained at \$65 and \$70, with but little stock in the market. Burnside has declined somewhat, and may now be quoted at \$40 to \$45. Potosi is advancing, and is in demand at \$375 at \$400, with little offering. Moray has been in request at \$30 and \$35, with plenty of buyers.

La Crosse is still without demand, and is in the market at \$10 and 14. Belvidere is firm and saleable at \$20, with little in market.

Cole is in request at \$15 for large lots, although the dealing in it during the week has been light.

Monte Cristo after a long quiet, is in request again, \$15 being bid.

Madison is offered at \$18 to 20, without buyers. It may be quoted at \$15. Texas is advancing slowly, and may be quoted at \$8 and 9, with a fair demand.

In Gold Hill an advance is observable and considerable business has been done in shares. Overman is saleable at \$45, and is rapidly changing hands.

Belcher is firm, at \$125 and 160. Koh-i-noor is firmly held at about the same figures. The ledge in controversy by these companies is one of the best in the Territory.

The Eureka was maintained at \$35 and 40 until to-day, when developments suddenly advanced it to \$50 and 55. Such is the report from Gold Hill.

Dunn has declined to \$4 at 5, but shows symptoms of a rally. Princess and Bullion remain at about \$40 and 45.

Buchanan is saleable at \$160 and 175.

The leading feature of Saturday was the developments in the Savage. On Friday one of the very richest character was struck, and brought to the surface Saturday. It is equal to the No. 1 rock of the Gould & Curry, which it very much resembles. The result has been an advance to about \$2,000.

Santa Rita is in the market at \$60 at 65. There is something of a disposition to deal in it at lower figures, but it is held firmly.

Birdsall is marketable at \$40 at 42 50, with an upward tendency. It is in the market in small lots at \$45.

Milton is quotable at \$30 at 35, although it is sparingly dealt in at these figures.

Pride of Washoe is offered at \$35, without bidders. It cannot be quoted at more than \$30.

Osceola may be quoted at \$9 at 10, with some request.

We quote Hazel Green at \$5, Bloomingdale at 5 at 6, York at 5, Allen at 60, Recorder at 20.

Yellow Jacket is offered at \$325 at 350, without takers.

Union is offered at \$50, in small lots. It may be quoted at \$45 at 50.

We quote Galeadonia at \$15; Baltic at 16 at 18; Leon at 20; Yolo at \$15 at \$18.

Best & Belcher is being dealt in to some extent.

Beach & Paxton is attracting considerable attention from the great width and favorable appearance of its ledge. For 50 feet \$235 was offered to-day, without sellers.

Keystone-Nebraska is being dealt in at \$10 at 12, with something of a demand.

20 feet Sacramento sold to day at \$62.

John R. Sims,

Oregon street, between Washington and Davis and Front and Jackson streets, SAN FRANCISCO.

**Manufacturers of Fire Proof Doors and Shutters, Bank Vaults, Grating, Cemetery Railings.** All orders from the interior Oregon, Washington Territory, Vancouver's Island, British Columbia, or any place on the Pacific coast, attended to with promptness and dispatch. Mr. Sims appreciates the past liberal patronage of his friends, and trusts that he may continue to merit it in the future. For the information of strangers he would say that he feels confident that his experience in his particular calling is surpassed by none on this coast, which his superior work, sent to almost every town in this state, Oregon, also Victoria and the Sandwich Islands, and to be seen on some of the best buildings in San Francisco, fully attest. A large assortment of second hand shutters for sale at low rates. ap3

## WANTED, GOLD QUARTZ SUITABLE FOR CUTTING JEWELRY,

By FRONTIER A. DEVERCY,

13 ap 487 Pine street, San Francisco.

## New Patent Agency.

Real Estate Purchased and sold, and Loans Nego-  
ciated.

#### WHEELER'S

##### Amalgamating and Separating Pans.

It is acknowledged by all who have examined the prin-  
ciples and witnessed the operation of these Pans, that  
they are decidedly superior for triturating and amalga-  
mating purposes to any other in use.

The most important principle connected with the opera-  
tion of these Pans is the separation of the triturating  
process from that of extracting the amalgam from the  
sand. The chief cause of loss of the precious metals aris-  
es from the passing off of the same in combination with  
the quicksilver, during the process of triturating, and in  
cleaning up. By the introduction of the Separating Pan  
to follow the triturating this loss is entirely avoided. In  
working these machines there is no appreciable loss of  
quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated  
by the side of others on sands from the same vat, the  
Wheeler Pans have uniformly gained a large percentage  
of metals over its competitors, as well as a still larger  
percentage in the amount of work performed.

\* \* These Pans may be seen in daily operation, at the  
Miner's Foundry, on First street in this city, where all  
interested are invited to call and examine for themselves.  
no16-1f ZENAS WHEELER.

## QUARTZ REDUCTION AND GOLD AMALGAMATING MACHINERY.

At no period in the history of mining has there been such an intelligent and practical application of inventive genius to mechanical contrivances for the reduction of quartz and the amalgamation of the precious metals as at the present time. An experience of twelve years in this branch of industry on a scale of magnitude without a parallel in either time or place has advanced Californians to the front rank of experimental miners; and at this time the miners of the old world—even the veterans of Cornwall and Wales are looking to California for the latest and most approved machinery in our peculiar speciality of extracting gold from its matrix. One of the most successful operators in the new gold fields in Wales, is a gentleman whose most important practical experience was obtained in the mines of California and Washoe.

In machinery for reducing quartz, we are fast narrowing down to a point. The numerous contrivances of mammoth "impingement" wheels, of ponderous rollers, cylinders, balls, etc., have all been cast aside forever, and there is every reason to believe that the few experiments which are now in progress will soon result in the adoption of a principle which, by common consent, will be recognised as the most economical and effective application of machinery to this purpose. If stamps are to be used, with the "wet process" triturating pans must come into invariable use, in connection with them. The experiments of the past two or three years have fully satisfied all practical miners that no "wet process," except grinding, will pulverise quartz to a sufficient degree of fineness to liberate anything like the entire amount of gold contained in the quartz, and every miner is also fully aware that any such process, by any machinery yet devised must necessarily be exceedingly slow.

Efforts are now being made to reach the required fineness by a direct process, and as to accomplish this the quartz must be reduced dry, a class of machinery has been introduced similar in its general construction to the "Smut Mills" in use in the wheat growing counties of the Eastern States, which admit of an upward discharge, that can be so regulated that none but the finest floating particles of dust can escape. One of these machines, the "Pond Crusher," manufactured at the Miners' Foundry, was recently illustrated in this paper. Another, now in use at the Pike's Peak mines, where it is known as the "Young America Quartz Crusher," instead of using revolving hammers, accomplishes the reduction by the simple velocity of its motion, the particles of quartz being struck are reduced to powder by "beaters," while suspended in the atmosphere. To accomplish this the beaters are made to move with a speed of from 12 to 15 hundred revolutions a minute. This latter machine has been constructed in this city by Goddard & Co., at whose foundry patterns of the same can be seen. It is claimed that by these machines the quartz may be crushed so fine as to need but very little reduction in the pans, which, indeed, need only be used as amalgamators. Both these machines are about to be submitted to practical tests on a large scale, the results of which will probably

fully develop their power, capacity and economy. Thus far their use has been mainly experimental, but with results which give much reason to hope for the eventual success of the principle. Of course we shall not fail to note any results for the benefit of our readers, as soon as they shall transpire.

Much progress has also been made in improving the "stamps." Probably the best stamp battery which has yet been constructed is that made in this city by Goddard & Co. It is made of wrought iron, durable, light, effective, and easily kept in order. The Ophir Company, at Washoe, has thoroughly tested the value and economy of this battery by working it in connection with the ordinary wooden stamps, and have decided to adopt it to the exclusion of the wooden ones. It discharges upon all sides, an arrangement which adds greatly to its effectiveness. This battery may be seen and examined at Goddard & Co's Foundry, on First Street in this city.

## OUR MECHANICAL INTERESTS.

The late extraordinary mineral developments on the Eastern Slope, the increased attention paid to the quartz mining interest, everywhere, throughout the State, and the renewed attention now being given to the mines of Sonora and Lower California, are adding vastly to the business of the Foundries and Machine Shops of this city, and to mechanical industry generally. The continuous demand for machinery for new mines, and for increase and renewal of machinery on old ones are compelling our foundries, in many cases to enlarge their area of business, and to add many additional hands and much machinery to their mechanical forces. Go where you may about the great work shops of this city, you will find evidences of most unparalleled prosperity meeting you upon every hand. The air of Front street and the lower portion of market, in particular, is resonant with the noisy din of the hammer and chisel of lath and anvil, while the sinews of iron and steel, moved by the untiring energy of steam, are constantly being brought into requisition as adjuncts to human labor. Thanks to the energy and enterprise of San Francisco mechanics and capitalists, our State is now fully redeemed from the thralldom of foreign dependence, and our miners and others are supplied with better machinery than could be obtained from the East, inasmuch as our mechanics and inventors have carefully studied and fully understand the peculiar necessities of the country.

A more intelligent and energetic class of mechanics cannot be found in the world than are now concentrated in this city. Being desirous to gain some idea of what is being done by our foundrymen and boiler makers, and make brief mention of the same in the columns of the Press, we took a hurried walk, a few days since through some of the principal shops, and were not a little astonished to note the magnitude to which this business had arrived within the last two or three years. The recent mining operations and undertakings on the Southern Coast have added vastly to the demands for machinery from our foundries and machine shops. No better idea of the magnitude and extent of this

new direction which is being given to our mining industry, can be formed, than by passing through six or eight of our principal foundries and noting the immense amount of machinery now being prepared for these mines.

These developments, though outside of the limits of the United States, are nevertheless as much conducive to the advancement and prosperity of this city as though the mines were located within the boundaries of California. All the wealth which they will create, all the commerce and industrial interest which they will call into life, will centre in San Francisco, and add directly or indirectly to the prosperity of each and all its inhabitants.

We propose to take up each foundry, separately, and endeavor to give our readers in future numbers, some idea of what is going on in these vast laboratories, where are concentrated the mechanical genius and skill of the Pacific Coast.

We regret that the limited extent of our columns will not admit of our devoting two or three pages in each issue of the Press, to the benefit of our mechanical interests. But we cannot do so at present. We hope ere long, however, to be able to enlarge the dimensions of our sheet to double its present size, when, in addition to our mining department, which will continue to form the leading feature of the paper, we propose to make the Press also the exponent of the mechanical interest of the State—in short, we aim to make it the "Scientific American" of the Pacific Coast. This is the plan we have marked out, and to this end we solicit the active co-operation of these two great industrial interests, fully aware that it is only by their aid and favor that we can achieve the success to which our ambition aspires. Thus far our progress has been flattering, and we have been greeted with many acts and words of encouragement.

**SANBORN ON COPPER.**—We are desirous to either purchase, or obtain the loan, for a few days, of a work entitled "Sanborn on Copper." Any person having said work will confer a great favor by forwarding the same to this office. We are unable to find the work in any of the bookstores or libraries of the city. Although several copies have recently been sold by Bancroft & Co.

**OPHIR MINING COMPANY.**—C. W. Lightner, late Superintendent of the Sacramento Gas Company, has been elected President of the Ophir Mining Company, *vice* J. W. White, deceased. The Office of this Company has been removed to Room No. 1, Express Building, Montgomery Street.

**OUR MINING LIST** is still increasing. We shall continue its weekly publication a short time longer, after which we propose to confine its issue to monthly terms. The frequent changes of the Offices and Secretaries of the various Companies render its permanent issue, in pamphlet form, as has been several times suggested to us, of no practical value. In a short time after its issuance in pamphlet, it would be as likely to mislead as otherwise. Our readers will find it of much more value in its present shape, corrected at regular intervals.

## THE HUMBOLDT MINES.

UNIONVILLE, MARCH 25, 1863.

MR. EDITOR: Perhaps a few lines about our country would not be amiss. We have cold airy weather and the mountains are covered with snow, but nothing hinders the sturdy, industrious miner from driving his tunnel. Ere long we will astonish the world with our rich mineral. A few Californians, with small capital have arrived among us and some purchases have been made. I will now give you the names, prospects, and amount of labor done on some of our most important ledges.

## PRINCE ROYAL DISTRICT.

This District is situated on Prince Royal Cañon, at the extreme northern end of the Humboldt mountain, and has many very important ledges; among them are the King, and Daniel Webster. Tunnels are being run to both of these ledges and shafts have been sunk on them—in the King ledge, to the depth of 35 feet. Tons of good rich mineral are lying by the side of the shaft. These ledges are both large and well defined. I think the King is second to no ledge in the Territory. It is about five or six feet wide and there is but little of the rock, which does not show mineral. On the opposite side of the hill three ledges are located, namely: Newton, Salust, and Colthurst. A tunnel is in progress to all three, and now run in solid rock one hundred and fifty feet. They have run across several rich spurs and are now into the casing of the Newton. The owners of the ledges consider the numerous spurs alone, sufficient inducement to put up a mill and work the rock; the ledge is large and well defined, having mineral streaks traversing the rock. Near the latter, is to be seen the Mark Anthony, Alsop, and Socrates. One tunnel is being run for the three ledges, and is in about 100 feet. No ledge is yet struck by this tunnel, but the ledges have been opened and a great quantity of argentiferous galena has been taken out, especially from the Mark Anthony. In one place I saw where they had run an open cut 15 or 20 feet across numerous spurs of pure mineral with a prospect of plenty more ahead. There appeared to be a solid mass of quartz, as far as the cut was run. Assays of all, or nearly all of this galena, prove it to be rich in gold as well as silver. The Prince Royal, American, and Yankee Blade are along the East Bank of Prince Royal Cañon. Two or three tunnels have been run, one 80 feet and the other about 50 feet, for the purpose of developing these ledges. The Prince Royal tunnel is a little past the perpendicular from the croppings of the ledge. This ledge is valued very highly. It shows plenty of fine mineral, but is not very wide, perhaps does not exceed three feet. Two mill seats have been located near the mouth of the tunnel. Pennsylvania, Napoleon, and Lilly, are the first nearest the Canon on the opposite side of the mountain. Tunnels are running to all, and they are all truly very fine ledges, especially the Napoleon, and Pennsylvania—narrow but very rich both in gold and silver. The Napoleon can be traced for over a mile. On this mountain are to be found the Washington, Honey and Lucinda—rich and well defined ledges, and from the quantity of mineral they possess I should judge they are not much inferior to any of the former ledges. Last but not least, stands the Fort Pitt. It is situated in the eastern portion of this district and is 4 to 6 feet wide and I never saw a piece of the rock but that contained mineral. It is now considered the equal of the Sheba or Mammoth, being on the same range north, but I consider it superior to either of them and believe it will furnish many a man a "home ticket." There are three companies, on this ledge and I do not think there is any choice in them, one is about as good as another. The ledge is easily tunneled as the mountain is abrupt. A plenty of wood is right about the vicinity of this ledge, and water sufficient for steam purposes. I know of no district or place more suitable for a mill than this Ravine at this lode. Several very rich ledges have recently been found on this range. Among them is the Ætna. It is equally as large as the Norton and has as fine mineral in the croppings as is generally found 50 feet below the surface. We come now to speak of the

## SANTA CLARA DISTRICT.

This is a small district, but a very rich one. The Magna Charta stands number one in this district. It is a well defined ledge and contains much very fine mineral, and is considered

a continuation of the Sheba North. I can simply say that it ranks second to none in these mountains and as soon as opened, in my opinion, will outstrip the original Sheba. The Wyoming, considered a continuation of the Mammoth, is truly a favorite ledge, the mineral is of finer quality, if anything, than the Magna Charta. It is a bold well defined ledge and held very high by the owners. The Kentucky is another favorite ledge of this district, contains plenty of mineral but not of quite so fine a quality. The Butte is well known to you all as being a very rich, small ledge. Tunnels are being run to all these ledges and much money has been expended on them, besides a great deal of labor, and I am certain this summer will prove this one of the richest districts in Humboldt Co. There are many other ledges here that are worth noting but I will defer the mention of them until my next letter. M.

## THE PIKE'S PEAK QUARTZ MINES.

A correspondent of the Territorial *Enterprise*, is giving some very interesting accounts from the Pike's Peak country, some of which we have already copied. We give further extracts from his correspondence, to-day. We have taken the liberty to rearrange some of the paragraphs.

## PECULIARITIES OF THE MINES.

The Pike's Peak ores contain no quartz. They are iron pyrites more or less mixed with copper pyrites, lead, antimony, etc. The croppings of the leads are a kind of brown granite, containing some quartz and a considerable amount of iron. On sinking upon this, however, veinstone of any kind is not found. The lead is a simple crevice in the granite bed-rock filled with a mass of pyrites. Free gold is sometimes found in the quartzose granite forming the croppings, but is never seen in the ore itself. I was shown pieces of pure granite, quite rich in free gold, of a beautifully bright yellow color. I saw but one or two specimens of pure quartz in which gold was to be seen. The veins of pyrites run in a northeast and southwest direction. There are numerous veins of quartz in the country, running almost due north and south. These have never been prospected to any depth. The miners don't like them. They don't want quartz—iron is what they are after.

When these mines were first worked, the miners supposed when the quartz gave out and the iron came in, that their mines were ruined. Then they all, in one grand chorus cursed the iron; now they curse the quartz, and hope to get down to where there is nothing but iron. While in Central City I was told that when the Gregory lead was first turned to iron, many supposed the country gone to the dogs. The owners as well as the principal business men of the Territory were greatly alarmed. The Gregory then was and still is, the leading mine in the country. If it petered it was like the Ophir fizzling, or Gold Hill giving out—all other leads in the Territory would be counted as naught. To save the lead and the country it was proposed to raise \$1200 by subscription to enable the company to sink through their iron. The money was raised and the work done. My informant was one of the subscribers to this fund, and he laughed heartily when he told me that it was soon discovered that the iron was richer than anything they had yet found in their mine. They had raised twelve hundred dollars to enable the company to dig and hoist ore worth one hundred and fifty dollars to the ton.

## THE ORES

as seen at the mills, are wholly free from clay or dirt, being but a clear heap of mineral. The ore is generally of a dark gray color, with yellow, shining pyrites visible on its surface, and often showing many bright rainbow tints, such as red, blue, green and yellow. I do not doubt but the ores of many mines in Colorado contain a considerable per cent. of silver. The American Flag and Kentucky, situated near Central City, present much the same appearance as the Sheba and other ores from the Humboldt mines. None of the mills at present in operation in the Territory would save anything but native silver. I saw ores from clear creek County, south of Central City, from a lead called the Whale, which were principally antimony, and might contain considerable percentage of silver. I was told that ores of this nature—that is principally composed of antimony and lead—were quite common on the west side of the mountains, but were not much liked by miners, leads in which iron predominates being more sought after.

The leads are not so wide as with us, generally but from two to six feet; but a few are much wider. In every case the ore of a mine becomes rich as the mine increases in depth; this was told me by everybody, and I could find no person who knew of a single exception to this rule. What everybody says must be true; therefore, all the Pike's Peak folks have to do is to go down deep enough and all their mines will pay. The country is full of leads, but very few of them are worked—only scratched over.

## PECULIAR MODE OF MEASURING THE ORES.

A cord of ore weighs from five to eight tons, owing to the

nature of the ore. Ore from near the surface, containing more or less blossom rock, is generally considered higher than that from a greater depth, containing little rock. The awkward plan of calculating and measuring their ores by the cord, instead of the ton, has done much to hurt the country. It has kept the miners and capitalists of California and Washoe in the dark as to the richness of the Pike's Peak mines. The papers of Colorado might just as well tell the mining world that they had ores paying ten dollars per basketful as to say that the Bobtail pays thirteen per cord. People know that there is a great difference in the weight of rock—a great difference in that from the same mine—and don't know whether there were five or ten tons of ore crushed to obtain the sum mentioned, and not knowing, are apt to throw aside the Colorado papers and think no more of the Pike's Peak mines. Assayers find measuring ores by the cord very inconvenient, or they must not only weigh the sample tested, but find out what part of a cord it is—this, an assayer told me, was generally ascertained by shrewd guessing. Ores are all hauled by the cord. Thus the man who has a rich lead, which is generally nearly all iron, and very heavy, gets his ore hauled at the same price as that paid by the man who is just opening his mine and has not yet got down to the rich heavy rock. It is also crushed by the cord, and a cord of the rich and heavy rock is crushed just as cheap as the poor and light ores. Were these light ores hauled and crushed by the ton, the saving in an hundred tons might make the mine a paying institution to its owners, instead of a losing one, as often happens. A few pairs of large scales erected in convenient places would soon effect the desired change, and make the doings of our Pike's Peak friends intelligible in other parts of the mining world.

## COST OF CRUSHING.

The price charged per cord for crushing is fifty dollars—ten dollars per ton, calling a cord five tons, or eight dollars and two bits per ton, counting eight tons to the cord. This leaves a very handsome profit to the owner of the ore when the cost of digging is not too great. The ore cannot be dug out with picks, however, as is generally the case with us, but every pound must be blasted out.

## MINING LAWS.

When a miner has found and recorded a lead it is his to all eternity. Glorious for lazy miners, but bad for the progress of the country. A man may locate fifty or a hundred claims, then set down and wait for somebody to strike something rich in the leads on which he owns. This is the plan of development chosen by the majority of claim-holders. One hundred feet on a lead is a claim—that is, one hundred feet square, and if a lead pitches out of this square it belongs to the man whose square it enters. But, in general, the leads run nearly straight down. Each locator, as a general rule, takes his claim by himself—is himself the company and the company's mother. There should be some time fixed for the expiration of the location. There are doubtless many very good claims standing recorded in the names of persons who have not been in the country for years; according to the present laws the person who should develop these would be liable to be driven off by the first locator, should he hear that something good had been found on his old claim.

## MILLS OF PIKE'S PEAK.

There are no large or very costly mills in the Pike's Peak mines. Their best mills are such as could be built at a cost of eight or ten thousand dollars in Nevada Territory. They contain but little machinery—nothing but the stamps for crushing, and copper plates and blankets in sluices for saving the gold. They do not even use the shaking-tables common in the old-fashioned California mills. Nearly all the gold saved is caught on the copper plates. Their stamps are ridiculously light, weighing but from four to seven hundred pounds. Then the cams by which they are hoisted are so long that the stamps are obliged to take a laughably long journey upward, when we consider the effect of this fall before coming down. It would appear to a Washoe mill man, watching one of these batteries, that the stamp spent nearly all their time in going up, yet, if he watched closely, he will find that every once-in-a-while one of them comes down—comes down with a crash equal to that of the clasher of an old churn. All the mills, however, are so slow coaches. Many millmen have shortened the cams, and consequently their stamps no longer go such long journeys heavenward; but they nearly all retain, believe I swear by their light stamps. A row of batteries, twenty, forty or eighty stamps, each stamp weighing a thousand pounds, would frighten them, especially if they can down as frequently as they do in our Washoe mills. No astras or pans are used in any of the Pike's Peak mills that I saw or heard of, with one exception. The mills do not save much over one third of the gold shown by assay to be contained in the ores.

## RICHNESS OF THE MINES.

They have, perhaps, twenty leads paying one hundred dollars and upward per ton, many that pay from twenty to fifty. The Gregory, Gregory Extension and Bobtail are about the best paying leads at present, though there are a dozen others nearly as rich in the same neighborhood. These we pay from five hundred to fifteen hundred dollars per cord, from one quarter to one fifth that amount per ton. Assays made long since, have shown that a large number of the veils

of the country were of extraordinary richness. Capitalists have been told this a thousand times over, and it is a shame that they should have haggled their wealth to their hearts and allowed poor men to struggle for years with difficulties that science which capital could have commanded would have at once surmounted. But capital is notoriously timid; however, had they applied upon the Pacific instead of Atlantic coast they would have met with better success. Now, when they begin to need no assistance, plenty of capitalists will come in and build mills, availing themselves of the hard-earned experience of men who have struggled manfully for the victory gained at last over their stubborn ores.

EXTENT OF THE MINES, ETC.  
One by one the mill owners are getting their heads above water, and we may soon expect to see Pike's Peak one of the most flourishing mining counties of the world. The time is now near at hand when the mineral wealth of the country will be properly estimated. Men of capital will come in and invest in the mines. From all I could learn, there is an immense scope of mineral country stretching away north, south and west of the Central City mines, which has been little prospected, and that only by persons in the look-out for iron. Native tin has been found in some of the western counties by miners when panning for gold. This was supposed by them to be metallic silver, and at a time a silver fever raged in that section.

TO MINERS AND PROSPECTORS.

In view of the frequent accidental discoveries of valuable mineral deposits, other than gold, in almost every section of the State, which have of late been made, it is but reasonable to suppose that prospecting even in California, has but just commenced. The simplest and most universal of all metalliferous deposits is gold. It rarely occurs in any other form than that of "free gold" which is readily discernable to the naked eye. An examination of any rock or earth for gold is an extremely simple process. If its presence is suspected in alluvium, the simple washing of that alluvium in a pan is an invariable test. If in rock of any description; the rock pounded fine in a mortar and washed, in the same manner as alluvium, will usually expose its gold to the naked eye, if there is any there in paying quantity. The only exceptions, are where the gold is contained in iron pyrites, or copper pyrites containing also iron. In either of the two latter cases the presence of gold may be readily ascertained by placing the pyrites in any suitable vessel and keeping the contents at a moderate heat for from four to six hours, with frequent stirrings, by which means the sulphur will be evaporated, and the copper, if any is present, changed to a dull red color, and the gold retaining its natural appearance, on subjecting the whole to the usual panning process, may be readily seen by the naked eye.

Not so with other metals. Silver, copper, zinc, nickel, and many others appear in such a great variety of metalliferous forms as generally to defy all but the most practical and scientific eye. No description of these ores can be written which will afford any very important aid to the inexperienced in making explorations. After reading descriptions, however, and carefully examining the specimens described, the explorer may go out and search with some degree of confidence and intelligence. A study of the characteristics of the sulphureted ores alone, would lead an explorer to pass over, entirely unnoticed, the richest varieties of the ores known as Chlorides or Horn Silver, which, from the facility with which they may be worked, and their usual richness, are generally considered the most valuable of silver ores. There is much reason to believe that this variety of silver ore will be extensively found in all the volcanic regions of this State. So with many other ores.

Considering the great difficulty, in the present lack of cabinet collections, and other means of instruction, to acquire a practical mineralogical and geological education in this State, and desirous to aid, to our fullest capacity, the development of our mineral resources, we hereby make the offer to miners, prospectors and all others, who in their travels or explorations may come across specimens having the appearance of rarity or value, to carefully examine and pronounce upon the same, free of charge, as to their characteristics, value, etc., whenever any such specimens are brought or sent to this office free of cost to us. We have already been called upon in many such cases, and we shall at all times be willing to give our attention to any such requests which may be presented to us.

Our object is to furnish the miners of California with every class of information which shall be valuable to them in

the progress of their calling and in the development of the mineral resources of the State, and we know of no way in which we can devote a portion of our time more to the interests of miners than in the manner here proposed. The only equivalent we ask is that they shall do what they reasonably can to sustain and improve the paper devoted exclusively to their interests.

In carrying out the plan we propose, every miner and prospector should be at all times on the lookout for any new mineral. The ordinary rocks with which the miner meets in his travels and labor, and which possess no mineral value are usually well known. Whenever a rock presents any unusual appearance in conformation, color or other characteristic, attention should at once be given to it. There is scarcely a piece of quartz or rock of a quartzose nature, which presents any uncommon appearance in texture or color that has not been thus modified by the deposit or intrusion of some mineral substance. If such rock is found upon or near a vein of quartz it should be carefully examined "in place," and if the cause of its peculiarity is not evident and readily seen, it should not be passed carelessly by. There may be value in it, although the gold may not shine there. We shall commence in our next issue a series of articles describing as accurately and as intelligibly as possible all the ordinary mineral substances which may be likely to come under the notice of the California prospector; and we have the promise also, at an early day—probably within a week or two—of a series of articles under the head of "THE MINER'S LABORATORY," which will be prepared especially for this paper by one of the most skillful metallurgists on this coast, and which will be found of great value to the mining public.

SAN FRANCISCO MINING NOTICES.

ASSESSMENTS LEVIED.

- Assessments upon Mining Stocks have been levied as follows:—  
Garabaldi.—Assessment of \$1 per share, levied March 2nd.  
Sutro.—Assessment of \$1 per share, levied Feb. 23, payable March 23.  
Silver Quartz Mill Co.—Assessment of 5 per cent. levied Feb. 24, payable March 28.  
Napoleon (copper).—Assessments of \$3 per share levied Mar. 3, payable in 30 days.  
Golden Age.—Assessment of one dollar per share levied Feb. 24, payable March 26.  
Washoe Gold & Silver.—An assessment of 2 per cent. on capital stock was levied Feb. 16, payable Apr. 1.

GENERAL NOTICES.

Coso Silver Mining Co.—The Office of this Company has been removed from the Stevenson House to Nos. 11 and 13 Court Block, No. 636 Clay street between Montgomery and Kearny. Entrance on both Clay and Merchant streets.

SUBSCRIBE.—Are you a miner and not a subscriber to the MINING AND SCIENTIFIC PRESS? If so, you are an annual loser of many times the price of a year's subscription, particularly if you are engaged in quartz mining. The same amount of practical information, important to miners and mechanics, which is contained in a volume of the PRESS, cannot be bought from the shelves of any bookstore in the country for the price of several year's subscription. Do you ever send a paper to the "Old Folks at Home?" If so, and you desire to send important information and valuable reading matter, you can find no paper that will be read with so much eagerness by them, or one that will convey to them so full an account of the real industry of the country as the MINING AND SCIENTIFIC PRESS. We invite all to send us their names and four dollars, or two dollars for six months, and become patrons of the only mining paper printed on the Pacific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examination, and with the hope that it may so far meet with their approval as to warrant their subscribing for it at once. It is not our usual custom to receive a subscriber for less than six months; but inasmuch as we are anxious to introduce the paper where it is not now known, we will, for the present, send the PRESS for three months even, on the receipt of one dollar, in coin or stamps. It is our belief that no one will wish to discontinue the paper after being a constant reader of it for even that short period.

Mining and Scientific Press.

The MINING AND SCIENTIFIC PRESS is published at the Exchange Building, Room 27, corner of Battery and Washington streets, San Francisco, Cal., at FIFTY CENTS per month, or \$4 per annum, in advance.  
C. W. M. SMITH and W. B. EWER, Proprietors.

Engravings, Electrotypes, etc.  
We execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STENOGRAPHY and ELECTROGRAPHY, Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing. Job Work executed with dispatch at low rates. PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast to the best Advertising Medium to be found in the country.

To Printers.

AN INTEREST in one of the most flourishing and best paying Newspaper Offices in the mountains is offered for sale on easy terms. A rare opportunity is hereby presented to any printer desirous of establishing himself in a good business in one of the healthiest, most thriving and delightful mountain towns in the state. For further information enquire at this office.

MINING AND SCIENTIFIC PRESS.  
THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.  
THIRD YEAR! VOLUME VI.—NEW SERIES!

A new volume of this extensively circulated paper commenced Sept. 11, 1862. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.  
This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!  
Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

The Inventor!  
Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!  
Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects, Millwrights and Farmers!  
This Journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply supplied.

Terms.  
To mail subscribers:—Four Dollars per annum.  
Club Rates.  
Five Copies for Six Months, \$8.  
Ten Copies for Six Months, \$16.  
Ten Copies for Twelve Months, \$30.  
Fifteen Copies for Twelve Months, \$44.  
Twenty Copies for Twelve Months, \$56.  
For all clubs of Twenty and over, the yearly subscription is only \$2 50. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

EWER & SMITH, Publishers,  
Room 27, (formerly) U. S. Court Building, Corner of Washington and Battery streets, San Francisco.

Our Mint, its Rules, Charges and Operations.  
For parting silver from gold when gold is below 300-1000ths. fine . . . . . 3cts per oz.  
" from 30-1000ths. to 750-1000ths fine. 7 cts " " oz.  
" 750-1000ths to 950-1000ths " 14 cts " "

DEPOSITS SILVER BULLION—PURCHASES.  
\$1.21 per standard ounce 1/2 per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300 3cts. per oz. gross weight  
301 " 500, 7cts, " " " "

DEPOSITS FOR FINE BARS  
\$1 16-4-11ths cents. per standard ounce, 1/2 per ct. gross value of silver for making bars; also when gold is contained 1/2 per ct. on gross value of gold for coining. Refining charges as in purchases.

Bars Sold FROM REFINERY.  
\$1 21cts. per standard oz. 1/2 per ct. gross value to be added for making bars.

DEPOSITED FOR DOLLARS.  
\$1 16-4-11ths. per standard oz. 1/2 per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

DEPOSITED FOR IMPORTED BARS.  
\$1 16-4-11ths. cents per standard oz. 1/2 per ct. gross value of deposit for making bars.

## MINING PROGRESS IN ESMERALDA.

From the local papers and from private advices, we notice that mining operations in Esmeralda, and that portion of the Eastern Slope, included in Mono County and the eastern section of Tulare, are being pushed with much vigor and energy. The most active efforts are being made to properly develop the mines, and render actual the suppositious values now represented upon the Stock issues of the Mining Companies of that region. We subjoin a few remarks collected from various reliable sources :

The *Aurora Times* speaks of a bar of gold and silver, the product of 9½ tons of rock and boulders taken from the surface of Mr. Preble's claim on Silver Hill. The bar as assayed \$29 32 in gold, and \$357 32 in silver.

The Ural Company are rigorously executing the work up on their lode, located upon Last Chance Hill. Their stock at last dates was held firmly at \$525 (α \$550.

The Bamboo are pushing ahead with their work night and day, and taking out rich ore, which is being crushed at Belden & Gregory's mill.

The Antelope is taking out better paying ore than ever. The *Star* of April 4th speaks of the rock which was then being raised as showing much gold and streaked with blue veins of silver sulphurets. We see no reason why the stock of this company should have depreciated of late in this city. It was sold at the Esmeralda Stock Board on the 16th inst. for \$400, since which time it has ranged in this city from \$300 to \$340. This mine is evidently improving with its depth. There are two shafts now being sunk upon the mine. This Company crushes its own rock, in an 18 stamp mill, with 16 amalgamating pans.

The Jennie Johnston, located between the Wide West and Garabaldi, is now being opened. The parties engaged in sinking the shaft are taking out rock which shows much free gold.

The Rose Dale, the Manning, Spring Valley & Magnet consolidation, are also in progress of active development. The latter named company is located but a few yards distant from the Wide West.

The Locomotive, on Silver Hill is turning out rich rock. Free gold and silver sulphurets are seen profusely in the rock. The shaft is now down about 100 feet and the rock is represented as appearing equally as rich as that from the Utah.

The Lady Jane, next adjoining the Locomotive, is also turning out very fine looking rock, plentifully sprinkled with sulphurets of silver. Its close proximity to the Antelope and Utah and other rich claims, aside from its actual developments warrants the belief that this ground will soon become very valuable.

The quartz mills in this region are enumerated as follows in the *Aurora Times* :—

The Union Antelope and Brodie, in good order and running. The Wide West (new) also running and the Spring Valley. The Winter's mill, up to very recently in good order and running constantly.

The following are not running—most of them being under repairs—but will be ready to resume work in a short time : Moses, Wide West old mill, Napa, Gibbons, Tucker & Stark.

Mr. Fogus of Sacramento, contemplates the erection of a new mill. The material and machinery are on the way, and expected soon to arrive. Mills are needed, and those of the very best and latest improved apparatus attached for saving the precious metals. The rock is here which contains sufficient gold and silver to insure large profits to the capital and labor engaged.

The Wide West, according to the *Star*, located on Last Chance Hill is being worked night and day. Their new mill is working finely. It has 20 stamps and 40 pans. Preparations are being made for the erection of additional buildings for the accommodation of settling tanks and furnaces.

The Pond Company at latest dates were sinking an air shaft for ventilating purposes. The rock from this mine is crushed at the Union mill.

The Fallstaff are sinking a shaft on their claims, 100 feet deep. The Silver Hill Consolidation have 75 tons of rock out.

The Bright Star, or Middle Hill, have sunk a shaft to the depth of 210 feet, at which they commenced drifting for

their lode. The Tiger is down 109 feet and have 75 tons of rock out. The Strawberry have a shaft down 100 feet and are on the ledge with good indications.

The Climax have a shaft down to their ledge, which is 8 feet inside at the point of intersection. The Hanson, on Last Chance Hill are down 65 feet, with a good ledge at the bottom of the shaft, and rock said to bear much resemblance to the Ophir. Work is being actively prosecuted in numerous other claims, from which important developments may soon be expected. The miners of Esmeralda have adopted the right method of bringing their mines into notice—by thoroughly developing their values. Speculative mining will not build up any place permanently.

The *Bulletin's* Esmeralda correspondent of April 13th says :—

The new Wide West mill has at last started, and for completeness of machinery and general success, it is unequalled in the district. The mine looks magnificent and is rolling out tons and tons of the richest kind of ore. The Antelope mill is running and the rock yielding largely. The Union mill still continues on Pod rock, with splendid success—the last clean up yielded over \$100 a ton. Gregory's mill is crushing Subbeam. Bodie's mill is still running on Bodie rock. All property in general is looking up, in the face of thousands of tons of quartz all stuck up, waiting for a turn. A new mill said to be a very fine one, is on the way here, belonging to a Mr. Fogus, late of Sacramento. He has a small battery attached to the main ones, calculated to crush a few hundred pounds of rock, and from that to judge of the value of any large lot sought to be worked by any company or offered for sale to the mill. The idea is an excellent one and should be adopted by all mill men of the district.

The Winters mill is said to have passed into the hands of the Real Del Monte Consolidation.

Work is going on at a great rate all over the hills, and incorporations are the order of the day. The superintendency of the Bambos has changed hands, Mr. Kyle taking the place of Dr. Howard. The change is expected to be productive of great benefit to the company and shareholders, as the new superintendent is one of the most thorough, practical miners in the country.

A contract is being let on the Young Winnemucca, for a tunnel of 700 feet, to tap the ledge 350 feet deep. The company has taken up a mill site near the proposed commencement of the proposed tunnel, and they will no doubt get the water needed from the tunnel, as the shaft at 60 feet depth has an abundance.

PROJECTED NEW PUBLIC EDIFICE

There are now six Temperance organizations in this city which pay an aggregate of \$132 per month for rent. We understand that it has been proposed to erect a building, in some convenient locality, finishing off the lower floor for stores, which it is supposed will let for a sum sufficient to pay a fair rate of interest on the entire property, thus securing a hall, rent free, to the several societies. An architect has already prepared a design well calculated for such a structure, and we understand that there will be no difficulty in procuring the necessary amount of funds, as soon as a suitable lot can be found.

We believe the Odd Fellows put up their Hall on Kearney street, on this plan, and we understand it works fully as well as anticipated. Money can now be had at a very low rate of interest. Indeed a large amount might be readily raised in the city by voluntary contributions in aid of the undertaking. Many, who never have, and probably never will unite with or take an active part in any temperance organization, are, nevertheless, free to acknowledge the great benefit derived therefrom by community at large, and are not only willing but anxious to do something, pecuniarily, for their aid. The donations from such sources would probably be amply sufficient to make such an advance on the property as would render the balance of indebtedness perfectly secure at the lowest rate of interest—say one or one and a quarter per cent. We trust the temperance people will be able to mature some plan for building on this basis. It would have a tendency to unite more closely the friends of the cause, and to give permanence and stability to the several organizations.

**APPOINTMENTS.**—Professor Whitney, the State Geologist, has been named as one of the incorporators in the Act recently passed by Congress incorporating the National Academy of Sciences. The first meeting of the Academy is proposed to be held in New York. W. H. Brewer also of the California Survey, has been appointed to the Professorship of Natural Sciences in the College of California.

HUMBOLDT Claims are beginning to be more favorably considered than heretofore, in this city, and a large amount of capital is finding its way into the "feet" of that region. The Sheba and other leading Humboldt stocks are beginning to be enquired for.

We had the pleasure, a few days since, of meeting our friend Charles Barber, who has just returned from that region, well stocked with "feet" of the most approved quality. We bade him adieu, about one year ago, as he started out from one of our mountain towns, a needy but hopeful adventurer into those distant regions. We now have the pleasure of welcoming him back, the possessor of claims which will to day enable him to "bank" a goodly fortune for any man. We rejoice in his prosperity, and cite it as but one of the numerous instances of good fortune which this wonderful country is daily developing.

Mr. Barber brings most encouraging accounts from the Humboldt men and has communicated much interesting and valuable information with regard to them, which we shall communicate to our readers in future numbers of the PRESS.

CONSOLIDATED BOARD OF BROKERS.—The Second and Third Board of Brokers of this city effected a consolidation last Thursday afternoon, and elected the following officers: President, Samuel Purdy; Vice-President, J. D. Stevenson; Secretary, J. H. Gager; Treasurer, J. D. Mathewson; Sergeant-at-Arms, C. Watson. The initiation fee is fixed at \$100. The Board now numbers 97 members, and meets daily at 1½ o'clock p. m.

MANY people consider the world as the worm does the interior of a nut—simply a place in which to feed and grow fat.

THE sales at the N. Y. Stock Exchange Board for the week ending March 1st amounted to \$9,209,000.

## REMARKS.

Notwithstanding the transactions in the Mining Market, for the past week have involved a much smaller amount of capital than usual, still there appears to be no decrease in the activity of operators. The number of transactions and the amount of feet transferred has probably been greater than during any corresponding period, as business has been mostly confined to second and third class stocks. As a necessary consequence great fluctuations have occurred, some stocks closing the week at an advance and a few falling off. Such a condition of things is inseparable with all mining operations of a progressive nature.

Among the stocks which have advanced we note the Daney, Savage, North Potosi, Lady Bryan, Chas. Caney, Napoleon, Utah and Governor.

Among those which have declined are the Antelope, Chollar, Silver Hill and Pond. In each case, the decline is but a simple fluctuation from which all will in all probability fully recover another week.

In Ophir, Gould & Curry, Central, Savage and Chollar, but little has been done. But 20 feet in the aggregate, has changed hands in these claims. Savage has been considerably sought after at the large advance of \$500, all we note but one transaction of two feet only.

The Daney has been in good demand throughout the week. We note an unusual number of sales. Commencing the week at \$313, this stock gradually advanced to \$316 and finally closed at \$400 @ \$500. The reports from its mine are very encouraging. We last week gave the results of the first and second weeks crushing as \$10,000 and \$21,000. We now add the third week at the materially increased figure of 30,000.

Chas. Caney. We still continue to hear favorable accounts from this mine, which is the first East extension of the Daney. They have struck a ledge in their new shaft at the depth of 50 feet, with good indications, due to 8 inch, 8-foot stroke Cornish pump is now being put up at the mine. To note a material advance in its stock during the week. It commenced at \$100 and closed firm at \$125 cash.

Lady Bryan still continues to be largely dealt in, and during the past week at steadily advancing rates. Opening at \$14, it closed at \$19½ br. 30.

## ESMERALDA.

Wide West has been subjected to a fluctuation from \$300 to 385, caused by an assessment of \$50 per share to liquidate indebtedness, at a time when many holders were expecting dividends instead. The accounts from the mine, which bear every evidence of creditability would seem to warrant a healthy condition, and it is difficult to see the necessity for the above assessment. The Wide West is undoubtedly all that is represented, and we are of the utmost confidence of soon having the pleasure of placing it on the list of dividend paying mines.

Antelope has declined about \$30 during the week. We are unable to see any reason for a decline in this stock. It appears to remain firm at Esmeralda, where a large portion of the stock is held, and where the condition of the mine should be best known. It is reported that the mine looks well, is turning out good rock, and that the mill is working finely. Such conditions ought not to admit of any depressing action upon its stock.

Silver Hill has fallen off in consequence of advices that they had lost their suit with Hanover.

The Melones, a new comer in this market has been much sought after during the week. Commencing at \$50 it advanced to \$125 and subsequently declined to \$80 @ 80 and \$100 seller 30 days.

An interesting detail of operations in Esmeralda will be found upon our 4th page.

## COPPER STOCKS.

Napoleon Stock has met with a material advance during the week, having gone up from \$26, last week to \$50 cash, and \$55 a 60 da. We are of opinion of the cause of this sudden advance, but presume it to be in consequence of favorable reports from the mine which has recently been placed under a new and able management.

## WASHOE STOCK REMARKS.

For the week ending April 11th, 1863.

[COMPILED FROM THE DAILY TERRITORIAL ENTERPRISE.]

Judging from the limited reports for the week ending with the present date, and from other indications we infer that the stock market in Virginia City has been somewhat sluggish for the past six days. On Tuesday a terrible storm of wind and driving snow kept the streets pretty clear of pedestrians, and appeared to put a pretty effectual check on transactions of all kinds. The absence also of any special excitement or "big strike" no doubt produced considerable effect on the market. The Enterprise reporter of Friday remarks that the brokers seem to enjoy the apathy with much relish, conscious that it must be of short duration. The business hours of the Boards were on that day devoted to amusing assays at further depressions, without a disposition even to fill orders or dispose of stocks to ready purchasers. This temporary inaction will be followed by unwonted animation, without a doubt, and that, too, within a few days. The developments everywhere being made must lead to an excitement in the stock market.

The Osceola, on Cedar Hill, appears to have furnished the only item of the week approaching to a sensation. Good ore and a very large ledge are

reported in sight. As a consequence the stock has advanced somewhat, and is reported to have been sold at \$20.

The Lancers Company have struck indications of a valuable ledge, and specimens of ore are being exhibited. This company's ledge, it is surmised, is a north extension of the El Dorado.

Very promising quartz, resembling in some respects the Comstock ore, is shown from works two miles north of Virginia, and the veritable Comstock, it is said by the enthusiastic, has been found in that locality.

The Potosi is advancing, and was in demand on Monday at \$416 @ 425. On Wednesday no shares were in market at less than \$475.

Sacramento is in market at \$62 50, and cannot be quoted higher. Selling is dull at these figures; thirty feet sold on Monday at \$62.

United States Tunnel shares are advancing and may be quoted at \$750 @ 800 per quarter share of \$16,000, with a fair demand and upward tendency.

Burnside is entirely inactive, and is in market at \$40 @ 42 50, without takers.

Norton is saleable at \$20 @ 22 50, with little offering at less than \$25 @ 27 50.

Belvidere is marketable at \$20, but higher bids are demanded.

The Insurance, a claim immediately back of the Beach & Paxton, is in request at \$10, to fill orders from below. It is generally held for higher rates. It is a San Francisco incorporation.

Baltic is in request at \$16 @ 18, at which rates two or three hundred feet have changed hands during the week.

Eureka, Gold Hill, is in request at an advance, in consequence of developments. We quote it at \$45.

The United States Mining Company who hold quite a number of parallel ledges just to the north of the Ophir have their tunnel now in 1650 feet and are expecting every day to strike the Comstock ledge. This company own some five or six parallel ledges. Their stock which is now worth about \$10 in the San Francisco market, will probably go up to a much greater figure as soon as their tunnel reaches the ledge. Among other shares tending upward in the Virginia District, we may mention the Fairview, Buchanan, Moray, United States, Birdsall, Utah, etc., although no very decided advance has occurred.

Gold Hill shares are in high favor and many of them are advancing rapidly. Leon is saleable at \$40, Princess at \$40, Overman at \$45, Belcher at \$150, Koh-i-noor at \$150, Yolo at \$20, Dunn at \$3, etc.

**Volcanic Smelting Furnace.**

PERSONS DESIRING INFORMATION AS TO THE USE of a economical properties of this Furnace, and intending to make use of the same, when satisfied of its superiority over all other means of reducing ores, and separating metals from the sulphurets, can obtain an explanation and advice in regard to the same, and the terms of sale of rights to use the same, on application of J. D. Stevenson or T. Ogg Shaw, or by letter to the proprietors through the Post Office of San Francisco. The drawings may be seen at the office of J. D. Stevenson, No. 814 Market street, or at the office of T. Ogg Shaw, in Brannan's Building, Montgomery street.

The time required for reducing ores by this Furnace is from three to eight hours, and the amount of fuel only one-tenth as much as is consumed by other processes.

The process of condensation is applied to this Furnace which will save all those portions of precious metals which usually escape in a volatile form.

The attention of all interested in the subject is requested to examine the important results obtained by this process.

Parties wishing will be allowed to erect a trial Furnace of capacity for smelting one ton of ore or more, on signing an obligation to pay the usual fee for the right to use it, should they continue to make use of the invention or a longer period than two months.

Feb 16 MRS. E. J. HALL, M.D., Proprietress.

**New Style of Lady's Buckle.**

W. BOHM, INVENTOR & PATENTEE

THE SUBSCRIBER HAVING OBTAINED LETTERS PATENT from Washington for an improvement in the construction of Ladies' Buckles, is now ready to furnish the same in every variety of style. This buckle possesses several very important improvements over any other in use.

The invention having been carefully examined at the Patent Office, has been adjudged to be a useful improvement, and Letters Patent have been granted for 17 years. It excels all other buckles in

**Usefulness, Strength and Appearance.**

The Public is respectfully invited to call and examine this Buckle at the Jewelry Establishment of

BRADYMAN & LEVY,  
621 Washington street, San Francisco.  
JOSEPH, BROTHERS,  
607 Montgomery Street, San Francisco.  
FLOBERG & CONRAD,  
118 I Street, Sacramento,  
Agents for the Patentee.

Every Buckle sold will be guaranteed as to its Strength and Durability.  
W. BOHM, Patentee.

## LEANDER RANSOM, Civil Engineer AND SURVEYOR,

Having been connected with the public works of the State of Ohio for 20 years, and the public surveys of the State of California for 7 years.

ALSO

**STATE LOCATING AGENT.**

And as such having the sale of

600,000 ACRES OF STATE SCHOOL LANDS.

At the low price of \$1.25 per Acre.

Terms—Twenty per cent in cash and the balance on a credit of several years.  
OFFICE: Second floor of Express Building, N. E. corner of Montgomery and California streets. oct-3m

COAL OIL EXPLOSION.—ON SATURDAY EVENING, while Mr. Brewster was engaged in the Summer Street House in pouring coal oil from one can to another, his wife imprudently approached with a lighted candle and the oil exploded. Mrs. Brewster's arms were badly burned, as were also the husband's hands. However, he succeeded in mastering the flames, and preventing worse consequences. [Evening Bulletin, Aug. 4.]

## 50 lbs. MARINE AND Fire-Proof Paint,

MANUFACTURED BY THE PACIFIC METALLURGICAL Works in this city, for Hulls and Decks of Vessels, from ground Mineral Rock contains Arsenic, Copper, Litharge and six other Minerals. When used on the Decks or Bottoms of Ships, it is equal to a coat of Stone, and quite equal to Copper, no worms will ever effect it, and cheaper than any other paint.

**DIRECTIONS:**

For Decks of Ships, use two parts Mineral Paint, one part White Lead, mix with Linseed Oil.

For Bottoms of Vessels, use one part ground sulphur three parts Mineral Paint, mix with Coal Tar and apply it hot.

For sale by all Ship Chandlers and Tradesmen, in boxes of 50 lbs. each, or by the Pacific Metallurgical Works.

**25 POUNDS FIRE-PROOF PAINT.**

When used on Roofs, Buildings, or Fences, it is equal to covering them with a coat of Stone, being perfectly Fire Proof, and costing less than any paint.

**DIRECTIONS:**

HOUSE.—Mix three parts Mineral Paint with one part white lead, thin with Linseed oil: if a lighter color is wanted, mix less paint, more lead.

ROOF.—Five parts of Mineral Paint, one part white Lead; mix with Linseed oil. Put it thick on a tin Roof as one coat when properly applied will last three years.

## WHEELER'S

## Amalgamating and Separating Pans.

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of triturating, and in cleaning up. By the introduction of the Separating Pan to follow the triturating this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

\* \* These Pans can be seen in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves.  
nol6-1f ZENAS WHEELER.

## PEOPLE'S Steamship Line! CONNECTING CALIFORNIA AND NEW YORK, VIA NICARAGUA.

750 Miles Shorter than any other Route!

SAN FRANCISCO, MONDAY EVENING, APRIL 27, 1863.

NO. 26.

#### TO CITY SUBSCRIBERS.

The experience of the past four or five months has proved the impossibility of a regular and prompt delivery of the MINING PRESS to city subscribers by any carrier, who has no other interest in his business, than to simply get through his routes, and draw his weekly pay. So much complaint has been made, that we have concluded to adopt the universal custom in this city, of placing our routes in the hands of a carrier, whose interest in it shall be to increase instead of curtail them, and who, for such reason, will be very likely to attend faithfully and punctually to his duty. We have made this arrangement with a party upon whom both ourselves and our subscribers can rely. Many of our subscribers have already expressed the desire that we should adopt, in their cases, the usual custom of calling upon them monthly for their subscriptions, and as it is desirable that the arrangement should be uniform, our carrier will call upon all others during the week, and such as are willing to become monthly subscribers can do so and settle with the carrier, for all arrearages. Our large and rapidly increasing city list renders it necessary that we should employ a man to devote his entire attention to it. We trust the arrangement will meet the approbation of our patrons.

**SILLIMAN'S JOURNAL.**—We have received the March number of the *American Journal of Science and Arts*, edited by B. Silliman, B. Silliman, Jr. and James D. Dana. This publication has now reached the 45th year of its existence, and is a standard work on all matters pertaining to science and arts—the only Journal of the kind on the Continent. It is made up of original papers and abstracts of foreign discoveries in physical and chemical science, geology, mineralogy, metallurgy, natural history, etc. It is a matter of congratulation among men of science, everywhere, that this standard publication has been able to stand the pressure of this extraordinary epoch, and continue its regular appearance even after it had been curtailed in circulation by the loss of a very large portion of its patrons who were dwellers of the Southern States. The number before us contains a valuable collection of papers, embracing within their range nearly every department of science and arts. This work is published every other month, by Silliman & Dana, at New Haven, Conn., for \$5.00 per year—each number containing 152 pages.

**REMOVALS.**—The office of the Lady Bryan G. & S. Co. has been removed to 605 Sacramento Street.

**M. G. ELMORE,** Mining Stock Broker, has removed his Office to No. 528 Montgomery St.

THE "Supplement" to the *News Letter*, forgets to credit the Press with the article entitled "Amalgamating Gold and Silver by Electricity," which it copies.

**BLACK INK.**—We have received a sample of "Pilkington's Black Ink," a very superior article and said to withstand the action of acids. It can be purchased at the corner of Montgomery and California Sts.

#### PROGRESS OF THE MINING INTEREST.

We continue our notices of mining progress in various sections of the State and adjoining territories. It is only by consulting such facts as we here lay before our readers that persons can act with judgement in their investments in progressive mining stocks. In a dividend paying mine, all that a purchaser cares especially for knowing is that the company is paying a regular percentage upon its capital stock. He then invests at a price per foot or share upon which the usual dividend will afford him a percentage which he considers an equivalent for the use of his money. He is a poor business man, who seeks an investment in an unproductive mine, without first informing himself as to its condition and the progress which has been made in its development. We shall hereafter devote a large space in our columns, and whatever time may be necessary, to collect all attainable information which may properly come under this head. We intend to make such information as reliable as possible, and our readers by filing their papers will soon have in their possession every material fact connected with the progress and development of every mining company which has an office in this city, and so far and fast as we can obtain reliable data, we shall also report progress upon all other companies, wherever on the Pacific Coast they may be located, or wherever their official place of business may be. In obtaining this information, we shall, of course, as a general thing, be compelled to take for our authority the statements of others, and whenever any misstatement or omission may be noticed we shall esteem it a favor in any one who will call our attention to it, and furnish us with the correct facts in the case.

#### VIRGINIA MINES.

**BURNING MOSCOW.**—This company is now employing about 20 men. They have a steam engine upon the ground for hoisting purposes, and the management of the mine has recently been placed in charge of a new Superintendent, Mr. Philip Deidesheimer, formerly Mining Engineer of the Ophir Co's mine. The mine is worked by an incline upon the vein, which yields good ore at a depth of about 70 feet. The prospects of the mine are such as to warrant a vigorous prosecution of the work. Drifts are now being run for a thorough development of the mine.

**WHITE & MURPHY.**—This Company has recently made arrangements for an immediate opening of the mine through the Latrobe tunnel.

**DESERT.**—This Company, situated in the Flowery district, near Virginia City, is not far from, and is supposed by many to be an extension of the Lady Bryan. But little has been done toward its development until recently. The Company has now however taken the necessary steps for its development by running a tunnel, sinking a shaft, etc.

**LADY BRYAN.**—Considerable attention has of late been directed to this mine in consequence, probably, of the appearance of some very rich ore in a new shaft which was being sunk upon the vein. The present condition of this mine is very clearly given in the following extract from the report of

Mr. Charles Bonner, Mining Engineer, to Mr. Teschemacher, President of the Company:—

"The general geological formation of the District is precisely similar to that of the Comstock vein. The outcrop of the vein is an immense mass of quartz, from 100 to 150 feet wide, of a good character, running in a northerly and southerly direction. The tunnel has been driven through the vein at right angles to its course, and passes through a similar thickness of quartz to that at the out-crop. But the quality of the rock indicates that it will have to be followed to a greater depth before good results can be expected.

The shaft now being sunk where some rich ore was cut recently, is in the Western Lode, intersected by seams and bunches of quartz, some of which contain very rich ore. The quality of the ore discovered in the shaft is excellent, but limited in quantity—a proof of the existence of rich ore in the vein at increased depths. The shaft now sunk is not at the place where the vein can be worked to advantage, and recommends a new shaft to be sunk in a westerly direction, to a depth of 1000 to 150 feet, at a point indicated by him to Mr. Owens, the Superintendent, and that an Engine, Pumps, and Working Gear, for hoisting rock, be immediately provided—an expense undoubtedly warranted from the present appearance of the vein."

#### ESMERALDA MINES.

**RIP VAN WINKLE.**—This Company is sinking a prospecting shaft, which, by last reports was down 35 feet. As soon as the ledge is reached prospecting operations will be commenced.

**BODIE BLUFF CONSOLIDATION.**—This Company are actively engaged in developing their several ledges. By last reports their shaft on the new Mexican ledge had reached a depth of 125 feet—on the Isabella they were down 90 feet; a shaft had also been commenced on the Osceola. We shall speak more fully of this in our next issue.

THE BODIE AND SILVER HILL CONSOLIDATION Co. has been organized by a consolidation of the Rising Sun, Grotto, El Dorado, and Climax Lodes. The Company has commenced operations on the several lodes, by tunnels and shafts.

THE JACK HAYS, SAM PATCH, SAN FRANCISCO AND TENNESSEE COMPANIES, are all recent Organizations in Esmeralda having their offices of business in this city. Active operations have been commenced upon each, by sinking shafts of suitable depths for an approximate development of them. We shall soon be able to report progress.

**WILLOW SPRINGS EXTENSION.** Middle Hill, are working their claim night and day and taking out ore said to be very rich.

**COSO S. M. Co.** This Company, whose lodes are located in Coso District, have their mill about completed, also the road to their mine. In a short time the rock from their various ledges will be tested by a practical working process.

#### SLATE RANGE.

THE CAYUGA, BLUE RIDGE, MADISON AND SAN FRANCISCO, all in the new Slate Range District, are in progress of de-

## VALUABLE ALLOYS.

**SILVER STEEL.**—One part silver, 500 parts steel, according to Faraday and Stodan. This alloy would be superior to the best steel. Steel also combines with other metals, such as nickel, platinum, manganese, &c.

**COPPER AND ANTIMONY.**—Seventy-five parts copper, and 25 parts antimony. This alloy is brittle lamellated, of a violet color, susceptible of a fine polish, and is more fusible than copper.

**BISMUTH AND LEAD.**—One part of bismuth, and 1 part of lead, a very tenacious alloy, melting at 165° Centigrade equivalent to 370° Fahrenheit.

Two parts of lead to 1 part of bismuth gives an alloy which dilates powerfully at the time of cooling. (This property makes it extremely suitable to all castings in which the greatest sharpness and finish are desirable.)

**BRILLIANTS OF FAHLUN.**—Thus called, are made from 29 parts of tin, and 19 parts of lead. A very fusible and brilliant alloy.

**TIN AND ZINC.**—One part tin, and one part zinc, is almost as tenacious as brass, and melts at 460° to 500° Centigrade, 900° Fahrenheit.

**TIN AND IRON.**—These two metals may be alloyed in all proportions. 35 parts of tin to 55 parts of iron form an alloy of a clear crystalline gray, and so brittle that it may be reduced to an impalpable powder.

**ANTI-FRICTION METALS.**—Many use 9 and 10 parts tin to 1 part copper. A superior composition to either of the above is, 1 part copper, 1 part regulus of antimony, to 10 parts of tin. Melt the copper first, then add the antimony, with a small portion of tin; cover up the whole with charcoal for a short time prior to casting; add the remainder of the tin. The compositions are solely used for lining brass bearings.

**FINE BRAZING SOLDER.**—Twelve pounds of copper, 11 pounds of zinc flux with powdered brimstone.

**A NEW GUN METAL.**—James T. Ames, of Chicopee Mass., has received a contract to furnish two guns to the Navy Department, which shall be made of a composition of metal of his own invention. It has borne an explosive force of 80,000 pounds to the square inch.

**INDIAN STEEL.**—The steel made in India is of such good quality that not only are Indian swords made from it, but the best of Persian swords likewise; and it is believed that the vast monuments of ancient Egypt must have been cut with tools made of Indian steel, in respect to the hieroglyphics on the intensely hard porphyry and syenite.

This Indian steel appears to be made from the magnetic oxide of iron. The ore is stamped to fragments, and the adherent quartz is separated by washing and sifting. The smelting is effected in the most primitive way; the furnace is built of clay, and not more than four or five feet high, the bellows is formed of two goat skins, with a bamboo nozzle, tipped with a clay tube at the end which is to be nearest the fire; the fuel is charcoal. The iron produced by the appliances is such as our manufacturers of steel would treat with little favor, but the Hindoo manages to obtain most excellent steel from it. The iron is heated to a slow red heat, and is beaten for a long time with a stone hammer on a stone anvil, the Hindoos having an opinion that iron implements are injurious. To convert this hammered iron into steel, it is broken into small pieces, and put into small crucibles with a little dry wood; the crucibles are stopped up with clay, and are put into a furnace where they are entirely covered with charcoal. A blast is then applied for two or three hours, the crucibles are removed, allowed to cool, broken and the metal is in a proper state to be fabricated into any desired form.

**WHITEWASH.**—This article as ordinarily made, rubs off the walls after it becomes dry, soiling clothes and everything coming in contact with it. This may be obviated by slacking the lime in boiling water, stirring it meanwhile and applying after dissolving in water, white vitrol, (sulphate of zinc,) in proportion of four pounds to a barrel of whitewash, making it of the consistency of thick milk. The sulphate of zinc will cause the whitewash to harden, and prevent the lime from rubbing off. A pound of white salt should also be put into it.

This makes the best whitewash known.

## NATURAL HISTORY.

A most important enterprise—important in a scientific light—has been recently undertaken by the friends of science in Nebraska. A company has been formed under the name of **THE ROCKY MOUNTAIN NATURAL HISTORY EXPEDITION**, to explore the Rocky Mountain region. Its originators are citizens of Nebraska, residing on the border of civilization, and almost adjacent to the proposed field of exploration and research.

It is the determination of the expedition to make complete collections of plants, dried and alive; seeds, cuttings and grasses; of birds of their skins and eggs; of shells and fossils; of skins of large animals, their bones and skulls; insects, fishes, minerals, etc. The expedition possesses all the necessities for collecting, curing, packing and transportation.

A Botanist, Naturalist, Geologist, and Taxidermist, will accompany the expedition, and make full and complete collections in their respective branches. There will be established in Nebraska City, a depot, where collections will be forwarded, as soon as sufficient quantities are collected for transportation. It is expected that the expedition will occupy three years, or until a thorough research is made of the Territory named. Subscribers, and those identified with the expedition, will receive their specimens annually, from the depot at Nebraska City. The expense attending an outfit so complete as this will be, makes it necessary that they receive aid from subscribers. Those who remit \$10 will receive a certificate of Membership and a collection. A Corresponding Secretary has been secured for the States, who will advise the subscribers of the success of the expedition from time to time. The expedition is expected to start for the mountains about the first of June, 1863.

Remittances should be made in Treasury Notes, by mail to R. O. Thompson, Secretary and Treasurer, Syracuse, Otsego County, Nebraska Territory.

That there is a field of deep interest to the Botanist, Naturalist and Geologist, in the Rocky Mountain regions of North America, has been already demonstrated by the collection of rare Plants, Birds, Insects and Fossils, that have already found their way to civilization from that quarter.

The Natural History of the Rocky Mountains within the Territories of Utah, Colorado, and New Mexico, is yet but partially developed, and it is to be hoped that this expedition to fully explore that region will be eminently successful in placing its Natural History before the people of the United States, in so complete a record that Science will receive a lasting benefit therefrom.

**THE HARRIS LEAD** at Brown's Valley, about 10 miles east of Marysville, has been in active operation since August last. The mill has all the modern improvements in machinery, and is paying at the rate of from \$4,000 to \$6,000 per month, above expenses. The entire property, we understand is owned by H. Harris, of Marysville. Quite a town has sprung up about the works and a neat church is soon to be erected, all through the enterprise and liberality, directly or indirectly, of Mr. Harris.

**PREVENTION OF DAMP IN GROUND FLOORS.**—Until recently no provision was made to guard against the absorption of moisture in the foundation walls of a house; lately, every working bricklayer knows that by the use of a single layer of slate (fixed in cement,) ever so little above the ground range of a foundation, the rise of damp in walls is repressed. What a catalogue of evils is avoided by this simple provision! The servants of an establishment are saved from all the penalties which damp walls are sure to entail upon the occupant of a basement story; all the aches to which the human constitution is subject are at once obviated; and apartments which, built on the surface, were formerly damp some two or three feet upward, or if sunken only four feet below the level, were damp to the ceiling, are now perfectly dry and fit for sleeping-rooms.

**A NEW METHOD OF EXTERMINATING RATS.**—A person being much troubled with rats, and being determined to get rid of them, tried every possible plan but without success. At last he got a lot of rats, and shut them in a cage; they devoured one another till only a single one was left. He then turned this one loose, who, excited with the blood of his fellow rats, and having become a genuine cannibal, killed and ate all the wild rats he could find on the premises.

## SUCCESSFULLY AT WORK.

The London "Pneumatic Dispatch Company" has commenced forwarding mail-bags through its underground tubes. This enterprise is novel. The Pneumatic tubes which have been laid by the company extended from the Euston Railway station to the Northern District post office in Eversholt street, London, a distance of only about one third of a mile, but sufficient for experimental purposes. The tube resembles an elliptical gas-main, thirty-three inches high by thirty inches wide, and is laid in nine feet lengths, at an average depth of nine feet below the street level. The joints are filled in with lead so as to be perfectly air-tight. Within this tube runs a wrought iron car, eight feet long, weighing eight cwt., and fitted with four wheels, each twenty inches in diameter. At each end of the tube is a hollow iron wheel, working in an air tight box of twenty one feet in diameter, which is connected with a steam-engine of seventeen horse power. The wheel turns at a velocity of seventy or ninety miles an hour, when the air is drawn in through its hollow centre and thrown off from its periphery with a force that gives a pressure of from five to seven ounces on the square inch. The iron cars in the tube present a surface of nearly five square feet to the blast, and are propelled at the rate of thirty miles an hour.

The entire cost of a line of five miles is estimated at \$650,000, and it is proposed to carry freight as well as mails through London, at the cheap rate of a penny (two cents) a ton per mile. So far, the experiment is successful, and the results are very interesting and curious.

**RED INK.**—Common red ink is made in the most simple manner, by mixing common carmine with a sufficient quantity of aqua ammonia to flow freely from the pen. Any person can manufacture red ink in a few hours by this method. A cheaper red ink may be made by boiling two ounces of Brazil wood for half an hour in a quart of water, then straining it and adding half a drachm of the chloride of tin and one drachm of gum arabic. Such ink is used for ruling red lines on blank-books. Carmine ink does not affect steel pens like that made from Brazil wood; none but quill or gold pens, however, should ever be employed with red ink. Liquid Solferino (aniline red) also makes a good red ink.

**POOR PROPHETS.**—It is remarkable how many predictions of men of science, in regard to the practical utility of important discoveries, have signally failed of fulfillment. When Sir Walter Scott heard that it was proposed to light streets with coal-gas, he said: "It can't be done; it's only the dream of a fanatic." Sir Humphrey Davy, the eminent chemist, said, in regard to the same thing: "It's all nonsense. You might as well talk of lighting London with a slice of the moon, as to talk of lighting London with gas." When the subject of ocean steam navigation was first proposed, Dr. Lardner demonstrated, as he supposed, by elaborate calculations, that the matter was practically impossible. When Franklin announced the identity of lightning and electricity he was laughed at. When Morse proposed to send a telegraphic message between Washington and Baltimore, he was regarded as a fit subject for the lunatic asylum.

Here is a queer statement—but if true, a very important fact for housekeepers:—

**TO PRESERVE EGGS.**—Place half a dozen at a time into boiling water, or as many as you can lift out at once with a skimmer, and leave them in the water from five to six seconds, and they will keep fresh for any length of time. This process coagulates a thin film of the white next the shell, and renders it impervious to the air, which is the cause of the putrefactive stage,—the shell being porous, and by laying a short time in one position, the yolk displaces the white and comes in contact with it and spoils.

**CORPORATIONS IN MONO COUNTY.**—The Aurora Times says: The number of Incorporations in that County, inclusive to the 1st inst., for Gold and Silver mining and other purposes, numbered two hundred and forty-nine. Since then other companies have been organized. The present number is 267.

**COPPER.**—The excitement over new copper discoveries still continues in every portion of the State.

## LATEST FROM ESMERALDA.

We receive by private advices from Esmeralda most encouraging word with regard to the mines in that District. The mines are very generally improving as the workings descend. Our correspondent writes "As we go down the poor mines are the exceptions," and adds, "The Wide West Mill runs like a top—you need not fear to speak well of this District, as to the mines."

**SHIPMENT OF TREASURE.**—The following is the list of treasure shipped for the East per steamer Sonora of the 23 inst.:

To New York.....	\$302,046 58
To England.....	765,072 57
To Panama.....	27,600 00
Total.....	\$1,094,718 95

An OIL SPRING has recently been discovered in Colusa county, on the Coast Range, and a company has been formed in Marysville to thoroughly prospect and work the same. If it shall prove as extensive as anticipated. The spring is situated about a mile from Simmon's Hot Sulphur Springs.

## TO MINERS AND PROSPECTORS.

In view of the frequent accidental discoveries of valuable mineral deposits, other than gold, in almost every section of the State, which have of late been made, it is but reasonable to suppose that prospecting even in California, has but just commenced. The simplest and most universal of all metalliferous deposits is gold. It rarely occurs in any other form than that of "free gold" which is readily discernable to the naked eye. An examination of any rock or earth for gold is an extremely simple process. If its presence is suspected in alluvium, the simple washing of that alluvium in a pan is an invariable test. If in rock of any description; that rock pounded fine in a mortar and washed, in the same manner as alluvium, will usually expose its gold to the naked eye, if there is any there in paying quantity. The only exceptions, are where the gold is contained in iron pyrites, or copper pyrites containing also iron. In either of the two latter cases the presence of gold may be readily ascertained by placing the pyrites in any suitable vessel and keeping the contents at a moderate heat for from four to six hours, with frequent stirrings, by which means the sulphur will be evaporated, and the copper, if any is present, changed to a dull red color, and the gold retaining its natural appearance, on subjecting the whole to the usual panning process, may be readily seen by the naked eye.

Not so with other metals. Silver, copper, zinc, nickel, and many others appear in such a great variety of metalliferous forms as generally to defy all but the most practical and scientific eye. No description of these ores can be written which will afford any very important aid to the inexperienced in making explorations. After reading descriptions, however, and carefully examining the specimens described, the explorer may go out and search with some degree of confidence and intelligence. A study of the characteristics of the sulphureted ores alone, would lead an explorer to pass over, entirely unnoticed, the richest varieties of the ores known as Chlorides or Horn Silver, which, from the facility with which they may be worked, and their usual richness, are generally considered the most valuable of silver ores. There is much reason to believe that this variety of silver ore will be extensively found in all the volcanic regions of this State. So with many other ores.

Considering the great difficulty, in the present lack of cabinet collections, and other means of instruction, to acquire a practical mineralogical and geological education in this State, and desirous to aid, to our fullest capacity, the development of our mineral resources, we hereby make the offer to miners, prospectors and all others, who in their travels or explorations may come across specimens having the appearance of rarity or value, to carefully examine and pronounce upon the same, free of charge, as to their characteristics, value, etc., whenever any such specimens are brought or sent to this office free of cost to us. We have already been called upon in many such cases, and we shall at all times be willing to give our attention to any such requests which may be presented to us.

Our object is to furnish the miners of California with every class of information which shall be valuable to them in

the progress of their calling and in the development of the mineral resources of the State, and we know of no way in which we can devote a portion of our time more to the interests of miners than in the manner here proposed. The only equivalent we ask is that they shall do what they reasonably can to sustain and improve the paper devoted exclusively to their interests.

In carrying out the plan we propose, every miner and prospector should bear at all times on the lookout for any new mineral. The ordinary rocks with which the miner meets in his travels and labor, and which possess no mineral value are usually well known. Whenever a rock presents any unusual appearance in conformation, color or other characteristic, attention should at once be given to it. There is scarcely a piece of quartz or rock of a quartzose nature, which presents any uncommon appearance in texture or color that has not been thus modified by the deposit or intrusion of some mineral substance. If such rock is found upon or near a vein of quartz it should be carefully examined "in place," and if the cause of its peculiarity is not evident and readily seen, it should not be passed carelessly by. There may be value in it, although the gold may not shine there. We shall commence in our next issue a series of articles describing as accurately and as intelligibly as possible all the ordinary mineral substances which may be likely to come under the notice of the California prospector; and we have the promise also, at an early day—probably within a week or two—of a series of articles under the head of "THE MINER'S LABORATORY," which will be prepared especially for this paper by one of the most skillful metallurgists on this coast, and which will be found of great value to the mining public.

## SAN FRANCISCO MINING NOTICES.

## ASSESSMENTS LEVIED.

Assessments upon Mining Stocks have been levied as follows:—

Garibaldi.—Assessment of \$1 per share, levied March 2nd.

Sutro.—Assessment of \$1 per share, levied Feb. 23, payable March 23.

Silver Quartz Mill Co.—Assessment of 5 per cent. levied Feb. 23, payable March 28.

Napoleon (copper).—Assessments of \$3 per share levied Mar. 3, payable in 30 days.

Golden Age.—Assessment of one dollar per share levied Feb. 24, payable March 26.

Washoe Gold & Silver.—An assessment of 2 per cent. on capital stock was levied Feb. 16, payable Apr. 1.

## GENERAL NOTICE

Coso Silver Mining Co.—The Office of this Company has been removed from the Stevenson House to Nos. 11 and 13 Court Block, No. 636 Clay street between Montgomery and Kearny. Entrance on both Clay and Merchant streets.

**SUBSCRIBE.**—Are you a miner and not a subscriber to the MINING AND SCIENTIFIC PRESS? If so, you are an annual loser of many times the price of a year's subscription, particularly if you are engaged in quartz mining. The same amount of practical information, important to miners and mechanics, which is contained in a volume of the PRESS, cannot be bought from the shelves of any bookstore in the country for the price of several year's subscription. Do you ever send a paper to the "Old Folks at Home"? If so, and you desire to send important information and valuable reading matter, you can find no paper that will be read with so much eagerness by them, or one that will convey to them so full an account of the real industry of the country as the MINING AND SCIENTIFIC PRESS. We invite all to send us their names and four dollars, or two dollars for six months, and become patrons of the only mining paper printed on the Pacific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examination, and with the hope that it may so for meet with their approval as to warrant their subscribing for it at once. It is not our usual custom to receive a subscriber for less than six months; but inasmuch as we are anxious to introduce the paper where it is not now known, we will, for the present, send the PRESS for three months even, on the receipt of one dollar, in coin or stamps. It is our belief that no one will wish to discontinue the paper after being a constant reader of it for even that short period.

## Mining and Scientific Press.

THE MINING AND SCIENTIFIC PRESS is published at the Exchange Building, Room 27, corner of Battery and Washington streets, San Francisco, Cal. at FIFTY CENTS per month, or \$4 per annum, in advance.

C. W. M. SMITH and W. B. EWER, - - - - - Proprietors.

## Engravings, Electrotypes, etc.

We execute at this Office Engravings and Reproductions on wood, stone, copper, steel, etc. STENOGRAPHY and ELECTROTYPING, Designs of every description—Buildings, sketches of Towns, Machinery, Steam Engines, Ships or China or Colored Printing. Job Work executed with dispatch at low rates. PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

## To Printers.

AN INTEREST in one of the most flourishing and best paying Newspaper Offices in the mountains is offered for sale on easy terms. A rare opportunity is hereby presented to any printer desirous of establishing himself in a good business in one of the healthiest, most thriving and delightful mountain towns in the state. For further information enquire at this office.

## MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

THIRD YEAR! VOLUME VI.—NEW SERIES!

A new volume of this extensively circulated paper commenced Sept. 11, 1862. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader, and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

## The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

## The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

## The Mechanic and Manufacturer!

Will be greatly benefitted by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

## To Chemists, Architects, Millwrights and Farmers!

This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmer and Planter will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

## Terms.

To mail subscribers:—Four Dollars per annum.

## Club Rates.

Five Copies for Six Months, \$8.  
Ten Copies for Six Months, \$16.  
Ten Copies for Twelve Months, \$30.  
Fifteen Copies for Twelve Months, \$44.  
Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 80. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

EWER & SMITH, Publishers,

Room 27, (formerly) U. S. Court Building, Corner of Washington and Battery streets, San Francisco.

## Our Mint, its Rules, Charges and Operations.

## For parting silver from gold when gold

is below 300-1000ths. fine..... 3cts per oz.  
" from 30-100ths. to 750-1000ths fine. 7 cts " oz.  
" " 750-1000ths to 950-1000ths " 14 cts " "

## DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce  $\frac{1}{2}$  per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300 3cts. per oz. gross weight  
301 " 500, 7cts, " " "

## DEPOSITS FOR FINE BARS

\$1 16-4-11ths cents. per standard ounce,  $\frac{1}{2}$  per ct. gross value of silver for making bars; also when gold is contained  $\frac{1}{2}$  per ct. on gross value of gold for coining. Refining charges as in purchases.

## BARS SOLD FROM REFINERY.

\$1 21cts. per standard oz.  $\frac{1}{2}$  per ct. gross value to be added for making bars.

## DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz.  $\frac{1}{2}$  per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

## DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz.  $\frac{1}{2}$  per ct. gross value of deposit for making bars.

velopment by shafts, etc. The shaft on the former is down 50 feet.

## HUMBOLDT.

Quite a number of Companies located in this region have recently been organized in San Francisco, and all are actively engaged in securing a proper development of their severnines.

The SHEBA, which was one of the earliest and is perhaps the best known mine in this district, is rapidly gaining in public favor. The ore from this mine is of a nature which will not yield to any of the various chemical processes now employed in this country for the reduction of silver ores. It can only be reduced by a process of smelting. It consists chiefly of an Antimonial Sulphuret of Silver, which, until this discovery, has ever been considered a very rare mineral, and, which we believe, has hitherto been worked only in Europe. The Sheba Company has 15 tons of ore now on its way to this city to be smelted here, with the view of fixing a per ton grade to which it may be assorted for the purpose of exportation for treatment in Europe. The lower tunnel, which is being run by this company and which we have described in previous numbers of the PRESS is now on the lead, and at a distance of 30 feet below the upper tunnel. The vein at this point is found equally as rich as in the upper tunnel. This new development has had the effect to considerably enhance the price of stock in this market.

THE STARLIGHT has shipped tools, etc., to their mine and will immediately commence the work of its development.

THE ESTRELLA DEL MONTE, THE MANHATTAN, THE COCHECO, THE SIEGEL AND ANNIE LAURA, late incorporations in this city, are all being prospected by tunnels and shafts, and their stock will doubtless soon acquire value in the market.

## REESE RIVER.

THE REESE RIVER CO.—This Company, the only location on Reese River, which has yet found its way to our mining table, is a consolidation of 16 different lodes, embracing an aggregate of 7880 feet, divided in 1200 shares of \$100 each. The Company has taken up 640 acres of timber land, 63 of which lie directly on the River. This location is directly on the Overland Route. Wells, Fargo & Co. have established an office in this neighborhood and a telegraph station is also about to be removed there. The Company's claims are made up as follows:—Little Giant 400 feet; National 480; American Eagle 600; Sigel 500; Stanton 400; Ericsson 300; Pony Extension 600; Lincoln 1600; Latham Extension 200; Overland 200; O'Neill 200; North Star 200; Oregon 200; Highland Mary 200; Black Rock 600; Cedar Hill 1200—Total number of feet 7880. The Company is now running a tunnel into Highland Mary, which at latest reports had progressed 190 feet. They will strike the ledge at a depth of about 400 feet. At 20 feet from the mouth of the tunnel they crossed a 15 inch lode which they think will pay well for working.

CALIFORNIA.

The MELONES & STANISLAUS Co., located in Calaveras County have recently struck ore of an extraordinary richness in a shaft at the depth of 35 feet. Some of this rock can be seen at the Company's Office, in Lucas & Turner's Building. The specimens are among the finest which we have ever seen. The rock is of a cream color, and shows gold all through the mass. One of the specimens shows a profusion of sulphurets of silver. This mine is in process of rapid development.

The ALAMEDA COAL Co. have their office in the same room with the Melones. This Company have eleven different veins or strata of coal included in their location. They are sinking a shaft, which has already reached a depth of 250 feet. They have some fine specimens of lignite at their office, which are indicative of a large vein, and which it is thought will improve as they go down, into a good quality of coal.

The SNEATH & CLAY GOLD MINE, recently opened, near Nevada City, appears to improve as the work upon the same progresses, surpassing all expectations, and surprising even the owners themselves. Developments, thus far, seem to indicate that this will prove one of the richest mines in the State, and will bear favorable comparison with the best in Nevada Territory.

The NEVADA QUARTZ MINING Co. makes the following favorable exhibit of their work for 1862 & 3.

	Tons crushed.	Ozs. Amal'm	Value.
1861-2.....	3,735	15,780	\$60,333
1862-3.....	4,785	17,655	67,305

LOWER CALIFORNIA & SONORA.

The GOBERNADORA S. M. Co., in San Antonio District, Lower California, are now taking out rich ore.

The MINA PRIETA Co., located in Sonora, Mexico, will have their machinery in operation about the 1st of July. The mine is now under the Superintendence of C. W. Boyington, Esq., late engineer of the Bensley Water Co. of this city. The Company has some 1500 tons of rock out, and about 90 men, mostly Mexicans, in their employ.

COPPER COMPANIES.

There seems to be no abatement, nor present prospect of abatement to the excitement in regard to Copper Mines. Not a day passes without bringing to our notice, either through the interior press, or through private channels, some new discovery or some wonderful development in mines already opened. It would be useless for us to attempt to chronicle all, or even half of the "discoveries" which we see reported; they would be of but little value to our readers. We have given from time to time such practical hints as we have thought would be of value to prospectors, most of which have been pretty generally copied by the interior papers. We have reason to believe that such paragraphs have been read with profit.

The Copper interest has now arrived at a stage of development which affords unmistakable evidence that it is soon to occupy a prominent position in the mineral resources of the Pacific coast. Several of the earliest discoveries have already arrived at a stage of productive value. Not less than 1200 tons of ore, assaying from 16 to 25 per cent, have been shipped from this port to Boston since the 1st of January. The principal part of this amount has been shipped by the Union company of Calaveras county, the balance from the Napoleon and Keystone.

THE UNION MINING Co., (not incorporated) hold 1950 ft divided into 13 shares of 150 feet, which are now held at a very high figure, with none in the market. The dividends of this mine are expected to reach \$20,000 per share, for the current year. No assessments have been levied by this company. The principal shaft at this mine is about 200 feet deep.

THE KEYSTONE is the first "extension" of the Union. The cost of opening the mine was \$24,000, which amount has already been realised. The mine is now in good condition, yielding about 100 tons of 20 per cent ore per month. It is an incorporated Company with 3000 shares. Its first dividend will soon be declared.

THE NAPOLEON COPPER CO. is located about four miles south of Copperopolis; it is an incorporated Company, with 2700 shares of one foot each. The assessments, thus far, have reached \$13,500, or \$5 to the foot. The stock is chiefly held in this city. The mine shows two distinct veins, and the ore is assorted to a grade of from 14 to 20 per cent. Large shipments of ore have already been made from this mine.

TABLE MOUNTAIN COPPER Co., Calaveras county, is now in active process of development. They have tunnelled 135 feet toward the vein, and commenced two shafts, one of which is down 112 feet and the other 45. Six hands are employed upon the work night and day.

THE ALTA Copper Company in Del Norte County is an incorporated association. The ore consists chiefly of Carbonates. Active operations are in progress for its development. The Company is already taking out ore of a good quality.

THE NEVADA COPPER MINING Co., near Grass Valley. We have already in a previous number of the PRESS, spoken of this Company as having struck very promising ore at a depth of 25 feet. It is incorporated in this city.

COPPER HILL MINING Co., is a newly incorporated Company which has recently commenced the development of its mine in the Solidad District, Los Angeles county. They have struck the lead in a shaft at the depth of 25 feet, with very excellent prospects.

THE OCCIDENTAL COPPER Co., in the same vicinity, have 20 men at work, driving a tunnel, sinking shafts, etc.

THE SOLIDAD G. S. & COPPER MINING Co., also in the same neighborhood, have let a contract for sinking a shaft 100 feet deep on their mine. They are now down 45 feet and are taking out ore rich in Gray Sulphurates of Copper. The company has three sets of hands at work night and day.—Mr. A. Woodside is Superintendent of the last named mines.

## AN IMPORTANT MOVEMENT

A joint resolution has been introduced into the Assembly to the effect that the State Geologist, the State Superintendent of Public Instruction, and the State Surveyor, be constituted a Board of Commissioners whose duty it shall be to report to the Legislature on or before the second Monday of December, 1863, upon the feasibility of establishing a State University, embracing an Agricultural College, a School of Mines, and a Museum, including the geological collection of this State, and that said Board report such facts and considerations as they may deem important in connection therewith.

We look upon the above as a most important movement. It is to be regretted that it was not made at an earlier day, so that something might have been accomplished in that direction during the present session. We look upon the suggestion as the most promising plan for diffusing valuable and practical information among the people, which has yet been proposed. It secures for the benefit of California the valuable donation of land given to this State in common with other States, for the establishment of an agricultural school. It will also give us a nucleus for the organization of a Mining School, which is one of the greatest educational needs of the State, and will render of practical utility the mineralogical and geological collections now being made by the State Survey.

MORE WONDERFUL DISCOVERIES are reported in the neighborhood of Reese River, the particulars of which have not yet been made public. We learn this fact from a letter written by I. J. Rolfe, Esq., for the Nevada *Democrat*, of which paper he is a joint proprietor. Mr. R., one of the parties interested in the discovery, is thoroughly posted in quartz mining. We are inclined to place some confidence in the reported discovery. Our confidence, however, would be vastly increased were we to hear that *our* patronymic had been recorded upon some of the first extensions of the richest of these discoveries. Mr. R. is writing some very interesting letters from that region, and joins in the universal acclaim of its wondrous mineral wealth.

## GENERAL MINING STOCK REPORT.

## REPORT OF SALES

**At the San Francisco Mining Stock Board.**

For the week ending April 18th, 1863.

[illegible]

**Volcanic Smelting Furnace.**

PERSONS DESIRING INFORMATION AS TO THE USE of a economical properties of this Furnace, and its ability to make use of the same, when saturated of its capacity over an other means of smelting ores and refining metals from the sulphurates, can obtain all the explanation and advice in regard to this same, and the right of rights to use the same, on application to J. B. Stevenson, or T. Ugg Shaw, or by letter to the office through the Post Office of San Francisco. The agents may be seen at the office of J. B. Stevenson, 214 Merchant street, or at the office of T. Ugg Shaw, Finance Building, Montgomery street.

The time required for reducing ores by this Furnace in three fourths hours, and the amount of fuel only one-tenth as much as is consumed by other processes.

The process of condensation is applied to this Furnace which will save all those portions of precious metals which usually escape in a volatile form.

Attention of all interested in the subject is requested to examine the important results obtained by this process.

Persons wishing will be allowed to erect a trial Furnace of capacity for smelting one ton of ore or more, on obligation to pay the usual fee for the right to it, should they continue to make use of the invention a longer period than two months.

Feb 16 MRS. E. J. HALL, M.D., Proprietress.

**New Style of Lady's Buckle.**

BOHM, INVENTOR & PATENTEE

THE SUBScriBER HAVING OBTAINED LETTERS PATENT on a Washington for an improvement in the construction of Ladies' Buckles, is now ready to turn out the same in every variety of style. This buckle possesses several very important improvements over any other in use.

The invention having been carefully examined at the Patent Office, has been adjudged to be a useful improvement, and the Patent has been granted for 17 years.

Advantages of other Buckles in

Usefulness, Strength and Appearance.

The Public is respectfully invited to call and examine the Buckle at the Jewelry Establishment of

BRAYFERN KLEVV,

621 Washington Street, San Francisco.

JOSEPH BROTHERS,

607 Montgomery Street, San Francisco.

FLORENCE & COMPANY,

118 1/2 Street, Sacramento.

Agents for the Patentees.

Every Buckle sold will be guaranteed as to its strength and durability.

W. BOHM, Patentee.

LEANDER RANSOM,

Civil Engineer

AND

SURVEYOR,

Having been connected with the public works of the State of Ohio for 20 years, and the public surveys of the State of California for 7 years.

ALSO

STATE LOCATING AGENT.

And as such having the sale of

0,000 ACRES OF STATE SCHOOL LANDS.

At the low price of \$1.25 per Acre.

Terms—Twenty per cent in cash and the balance in credit of several years.

OFFICE: Second floor of Express Building, N.E. corner of Montgomery and California streets. oct-3m

COAL OIL EXPLOSION.—ON SATURDAY EVENING, while Mr. Brewster was engaged in the Summer Street House in pouring coal oil from one can to another, his wife inadvertently approached with a lighted candle and the oil exploded. Mrs. Brewster's arms were badly burned, as were also the husband's hands. However, he succeeded in mastering the flames, and preventing worse consequences.—[Evening Bulletin, Aug. 4.]

THEN THIS!

Comet Illuminating Oil!

Manufactured expressly for Stanford Bro.

THIS POPULAR

Brand of Kerosene

Is warranted free from Camphene, Petroleum, or any other explosive material, and is the

BEST FAMILY OIL IN THE MARKET.

STANFORD BROTHERS,

## WHEELER'S

## Amalgamating and Separating Pans.

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of triturating, and in cleaning up. By the introduction of the Separating Pan to follow the triturating this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

\*These Pans can be seen in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves.  
no 16-1f ZENAS WHEELER.

## OUR MECHANICAL INDUSTRY.

We have already alluded to the wonderful progress which San Francisco has made during the past four or five years in mechanics and manufactures, and have proposed to give our readers a brief notice of some of these industrial establishments which are working out such vast accessions to the prosperity and permanence of our city and state. In continuing these notices from week to week, we do not propose to confine ourselves altogether to the large or "first class" establishments; for we are not unmindful of the fact that such have grown up, within a few years, from small beginnings, to their present colossal proportions, and that others that are now circumscribed in their operations, and kept back, for the time being, perhaps by the lack of capital or influential friends, have nevertheless all the ingenuity, skill and energy, requisite to manage the most extensive works of this description. All such are destined to advance with the growth of the city, and many an owner of a small establishment, or one who is now simply a working mechanic, filling long hours in dark and contracted shops, will ere long find themselves owners in large and flourishing establishments, with scores and perhaps hundreds of men in their employment.

The field of operations for mechanics in this city is unbounded. The demand for machinery for mining, milling, manufacturing, etc., is increasing with rapid ratio, and where ores are now employed, hundreds and perhaps thousands, will in a few years be required. Our mountains, north and south, from the very coast to the far interior, through and over the Sierras and stretching across the "Great Basin" right to the Western Slope of the Rocky Mountains, are full of minerals of every known description. So numerous are our mines, that explorations, instead of decreasing the chances for new operations, actually adds ten, twenty and hundred fold to the chances. Never before in the history of California, or indeed of the world, has there been such excitement about new mineral discoveries as at the present time, and never before was the faith of our people so firmly fixed in the absolutely inexhaustible nature of our mines.

Centuries have been insufficient to develop, to their present extent, the mines of the insignificant territories (insignificant in extent) of Cornwall and Wales. What approximation then can we, on the Pacific Slope, hope to make in a single century, toward the development of a territory ten fold richer than Cornwall ever was, and ten times larger in extent than the entire British Isles? When the nursing child of to-day shall walk our streets a tottering old man of our score and ten, he will behold in this city a population larger than is now collected on the entire Pacific Coast, but he will not see one particle of abatement in the mining excitements of the day, or notice any diminution in the number of "new discoveries" reported in the morning papers. These are sober thoughts—the legitimate inferences of present indications, which cannot be ignored, and of which we should not be unmindful.

San Francisco is to become the London of the Western world—the great emporium of Asiatic commerce in its transit

eastward, and the centre and radiating point from which are to proceed all the supplies of machinery and material of every description for the development of our mines and to feed and clothe the people of the interior. The re-opening of the deserted mines of Mexico, and the late wonderful developments on the Eastern Slope, as we have before remarked have already occasioned a largely increased demand for machinery over previous years; but the imagination can scarcely picture the enormous increase in such demand which present indications foreshadow. Nearly all this supply of machinery must be furnished in San Francisco. Scarcely a single decade has elapsed since the first steam engine found its way into the interior of the Pacific Slope. Now they may be numbered by thousands. A few years ago they were obtained chiefly from the East. Now the supply is obtained almost exclusively from the workshops of this city. Where hundreds of these tireless machines are now employed, thousands will soon be required. Indeed the time is rapidly approaching when the only limit to their employment will be the supply of fuel for their consumption.

The wonderful developments of the past few months are giving the mechanics of San Francisco, but a mere inkling of the great magnitude which this interest is soon to assume. This city must continue the workshop of the Pacific Coast. No other point possesses advantages which can, by any possibility, attain to any formidable rivalry.

## COPPER STOCKS AT THE EAST.

Considerable excitement is manifesting itself in Boston, about this time, in relation to copper mining. The present high price of copper, and the remarkable success that has recently attended the working of the mines, both at Lake Superior and in Canada, is attracting the attention of both investors and speculators, and it is believed that the returns of the next two or three years will be very important. Nearly all the Lake Superior Mining Stock is advancing.

The Acton Mine, Canada, is still making most satisfactory returns and its stock is in demand at advanced rates, with but little in the market. This mine within the past few months has proved itself to be very rich, and the vein improves, the deeper it is worked.

The subjoined quotations were recently given in the Eastern papers, as an evidence of the "great advance in Prices" in Copper Stocks. A similar advance in the San Francisco market, would scarcely be noticed, but in Boston, it is noted as something very remarkable:—

	Monday, Feb. 23.	Monday, March 9.		Monday, Feb. 23.	Monday, March 9.
Acton.....	6¼	5¾	Mesnard....	8	11½
Bohemian ..	9¾	9¾	Minnesota ..	84¼	106
Canada ....	1¼	1¼	National....	24	33

Isle Royal.. 26¼	33		Ruperior... 7¼	13¾	
Toltec..... 3¾	4½		Winthrop... 2½	3½	

## PRODUCT OF THE LAKE SUPERIOR COPPER REGION.

The Lake Superior News and Journal of Jan. 16, 1863, gives the following tables from the most reliable data attainable, showing the rise and progress of the copper business of the Lake Superior region, from 1845 to 1862. The amounts given refer to the rough copper produced as weighed and valued for shipment:—

Shipm'ts in Tons.	Value.	Shipm'ts in Tons.	Value.
1845 ¾	\$ 390	1854 2300	805,000
1846 29	2,610	1855 3196	1,437,000
1847 239	107,550	1856 5726	2,400,100
1848 516	206,400	1857 5759	2,015,650
1849 753	301,200	1858 5896	1,610,000
1850 640	266,000	1859 6041	1,932,000
1851 872	348,800	1860 8614	2,520,000
1852 887	300,450	1861 10337	3,180,000
1853 1452	508,200	1862 9020	.....

The authority before us does not give the estimated value of the yield for 1862, but makes the following allusion to it, in substance as follows:—Although the yield of the mines for 1862 is less in tons of ore than the yield of the previous year, still the amount realized from the sales of copper will be largely in excess of the amount realized in 1861, the price of copper being higher the past year. So that the mines have actually paid better than in any previous year.

The Lake Superior mining region is divided into three Districts, the Portage Lake District; the Ontonogon District; and the Keweenaw District. The first named contains seven producing mines, the second twelve and the third ten—making in all twenty-nine producing mines. The average product of these mines for the past year has been \$163.275—estimating the value of the copper produced at \$700 per ton. "There is no question," says the Philadelphia Mining Journal, "but that the peninsula of Michigan is a California in mineral value. Moreover, it is near by; for, when the Philadelphia and Erie Railroad shall have been opened to Erie City, it will not be long before the copper region of Lake Superior will become better known in this city; because, then, in a car hence to Erie City and a boat thence to the farthest of the great lakes, a visit to Copper Land will combine business with adventure, in a new direction.

With a descending navigation from Lake Superior to Erie City and a single rail interest thence to Philadelphia, there will be cheap and convenient communication with the mineral territory of the peninsula of Michigan."

CAST IRON has been recently experimentally manufactured at the Crevelea Iron Works, in Ireland, by the use of condensed peat. The quality of the iron thus produced is said to be equal to the best Swedish iron.

TELEGRAPH TO REESE RIVER.—Telegraphic communication has been established to Austin, in the Reese River country. The first message was sent from there on the 25th ult.

RICH.—Rock from the Monitor District, Nevada Territory, assayed at Virginia City, has turned out over \$8,000 to the ton.

## THE MINERS' LABORATORY.—NO. I.

We have already announced the preparation of a series of articles under the above head, in which we propose to give a brief digest of so much of the interesting Science of Mineralogy, as shall be of practical utility to the miner and prospector, in his labors and explorations in the field. These papers will be prepared from the latest and best authorities and will embrace the entire range of mineral and metalliferous deposits. We shall not waste the time of the reader to any extent, by any general remarks not strictly belonging to the subject under consideration, but endeavor, to the utmost of our ability, to render these papers a practical manual that shall be especially useful to the prospector and miner, and at the same time, not entirely devoid of interest and instruction to the general reader.

In order to treat the subject intelligently, however, so that it may be correctly understood by those who have hitherto paid but little or no attention to mineralogy, it will be necessary to give a brief introduction, explanatory of certain terms and conditions, which must be used and referred to. Without such explanations these papers will be of but little comparative value either to the general reader, or to the miner who may now, for the first time, desire to gain an insight into the science of practical mineralogy.

## INTRODUCTORY.

The primary object of this science is the development of mineral bodies; a knowledge of their characters, forms and combinations; also the circumstances and conditions in which they are found, and the substances with which they are combined. This is the PRACTICAL object of mineralogy and the point upon which we propose to treat principally in these papers.

A development of the nature of minerals, a knowledge of their elements, their properties and uses, constitutes the ECONOMICAL portion of the science, which though highly interesting and useful to mankind, is not a matter which we propose to discuss to any extent. The miner is directly interested only in the development—the bringing to the surface—of the minerals of the earth; their economy and general introduction into the various channels of business, he leaves to those into whose hands he delivers them in their rough state.

We know but comparatively little of the earth beyond the depth which has been reached by mining operations. This depth when compared to the entire bulk of the earth, may be correctly compared to the minute scratching and pin punctures of a coat of varnish on a 12-inch globe. All beneath is mystery and speculation. Of this we shall treat more at length in future numbers.

A Mineral is an unorganized body, differing from an organized or living body in its structure, in the manner of its formation and of its increase or growth. While organized bodies increase by means of their internal organs, which assimilate and retain in the system what is beneficial and reject what is useless, unorganized bodies increase externally.

A simple mineral substance, as pure gold, silver, etc., may be described as an organized body, presenting an aggregation of lesser particles of the same nature, united by affinity.

Every mineral possesses two distinct kinds of character, by one or both of which it may be distinguished from other substances. These are termed the *external* and the *chemical* characters. The former are commonly apparent to the senses, and the latter are those which are developed during the chemical decomposition, which may be accomplished with or without heat. These characters are denominated as follows:—Aspect, or kind of lustre; color; hardness; specific gravity; streak; form; structure; cleavage; surface; tenacity and transparency.

ASPECT, or Kind of Lustre, is very important, and is divided into metallic and non-metallic aspect; they are often blended in the same mineral. Many minerals also possess two distinct kinds of lustre, one externally and the other internally. The true metallic lustre may always be distinguished from the metallic, pearly-adamantine lustre, by its being always combined with perfect opacity, and by remaining unaltered on the scratched surface.

COLOR is also of considerable importance when combined with metallic aspect. In speaking of color, in connection with minerals, the depth or shade of color should be carefully noted, and the peculiarity of shade expressed as near as possible, by reference to some well known substance.—

The metallic colors are white, divided into silver and tin-white; grey, lead-grey and steel-grey; yellow, brass-yellow, bronze-yellow and gold-yellow; black and copper-red.

HARDNESS is one of the most important of mineral characters. There are generally reckoned ten degrees of hardness: 1, yields easily to the nail. 2, yields with difficulty to the nail. 3, scratches a copper coin, but is also scratched by it. 4, not scratched by copper but is not hard enough to scratch glass. 5, scratches glass, though with difficulty, leaving its powder on it and yields easily to the knife. 6, scratches glass and yields with difficulty to the knife. 7, does not yield to the knife but does to the edge of a file, though with difficulty. 8 and 9, harder than flint. 10 cuts glass.

SPECIFIC GRAVITY.—That is, the weight of a body compared to some other body of the same size or volume. This latter body is assumed as a standard; this standard is pure water at a temperature of 60° Fah. A cubic foot of water weighs 997.136 ounces—usually taken as 1,000. A cubic foot of silver weighs 10,000 ounces; therefore we say silver is ten times heavier than water, and its specific gravity is 10.0.

STREAK is a very effective character; it signifies the color of powder, produced by drawing or *streaking* a mineral across a file. The best way to distinguish the streak is to take a fine file, and drawing it once or twice across the mineral, pass it lightly over your finger; when the color will be thereon, and may be easily noted.

FORM is a character, when regular, of the highest interest, yet of limited utility in the discrimination of minerals.

STRUCTURE AND CLEAVAGE.—The structure of minerals is the mode of aggregation of the particles of which they are composed. *Lamellar structure* is composed of broad, distinct concretions, of about equal length and breadth. *Prismatic, or bladed structure*, consists of long and narrow concretions, forming a transition from the lamellar into the fibrous structure. *Fibrous structure*, consists of fibrous, or very thin and capillary concretions, either straight or curved. *Granular structure* is composed of minute or small concretions, having a nearly equal length, breadth, and thickness. *Compact structure* is devoid of any distinct concretions, and appears to consist of one compact mass.

SURFACE.—The surface of minerals may be either uneven, granulated, rough, smooth, or streaked: streaked surfaces often arise from a close fibrous structure, or otherwise indicate the direction of cleavage planes.

TENACITY.—The following are the different degrees of tenacity:—*Brittle*, such as grate under the knife, or fly off in the form of powder when attempted to be cut; and break into powder, when placed on an anvil and struck by the hammer. *Sectile*, possessed by minerals which yield in a great degree to the knife without noise, the particles remaining on its blade: sectile minerals crush into powder under the hammer. *Malleable or ductile*, the property possessed by minerals which may be cut by the knife, and which flatten into spangles under the hammer.

TRANSPARENCY.—The following are the degrees of transparency, or transmission of light, as possessed by minerals. 0. Opaque 1. Translucent on the edges. 2. Translucent. 3. Semi-transparent. 4. Transparent.

DEGREE OF LUSTRE is distinct from the kind of lustre or aspect of minerals. The degrees of lustre are marked by the following numerals. 0. Dull, devoid of lustre. 1. Glimmering. 2. Glistening, or weakly shining. 3. Shining, as rock crystal. 4. Splendent, or strongly shining, as galena.

FRACTURE is a character of minor importance; it is the appearance of the surfaces produced on breaking a mineral in any direction, except in that of its natural joints or cleavage planes, which ought to be always smooth, and more or less shining.

FORM, FRANGIBILITY, FLEXIBILITY, TOUCH, SOILING AND SOUND, are all terms which are sometimes employed to describe the characteristics of minerals, but as they are of little importance to the general student we pass them by.

ODOUR is confined to a very few minerals; some emit naturally a degree of odour, in others it is produced by breathing on them; in some by friction, and in others it is developed by heat.

ADHESION TO THE TONGUE is a character possessed by such minerals as freely imbibe moisture, and is common to almost all earthy mechanical mixtures and decomposed specimens,

TASTE is a characteristic properly possessed by such minerals as are soluble in water.

MAGNETISM is a characteristic of limited application, but in many cases a very important one. The only metals which attract the magnet, are iron, nickel, and cobalt; and there are very few that affect it in their natural state, but many do so after their exposure to the action of the blow pipe.

ELECTRICITY.—To ascertain whether a mineral possesses this character or not, a small instrument called an electrometer is necessary. Electricity is produced in minerals, either by heat or friction. To try if a mineral possesses the property of electricity, first rub it briskly for a few minutes with a woollen cloth, and then present it to one of the pith balls of the electrometer; or, heat it gently through and do the same; if in either case it attracts the ball, then it possesses electricity.

PHOSPHORESCENCE is a property possessed by some few minerals, of emitting by heat or friction, a faint light. Minerals which become phosphorescent by heat, will almost invariably be found to contain either fluorine, chlorine, phosphoric acid, boracic acid, or the salts of baryta, lime, or zinc. This is however, a very uncertain character, as there are varieties of the same substance in which it can and cannot be developed.

The chemical characters of minerals, are the effects produced on them by the action of acids and of the blow-pipe of which we shall treat in a separate article wherein we propose to give general directions for the use of the blow-pipe.

The effects produced on minerals by the action of acids are very important. These effects are effervescence, solubility, partial solubility producing a gelatinous mass, &c. To develop these effects, the mineral should be reduced to powder, and placed in a small test-tube or other vessel, and the acid, either pure or diluted, must be gently poured over it. The application of heat is sometimes necessary, in which case a spirit-lamp is made use of, and the mineral and acid supported over it in a test-tube, watch-glass, or small capsule of Berlin porcelain, or of platinum, by means of a thin bent wire.

The treatment of minerals by acids will be fully explained in its appropriate place.

MOISTURE IN THE AIR.—The atmosphere always contains water. Most people think its presence a misfortune. They say the atmosphere of California is very healthy because it is so dry. This is an error. The air of California has a great deal more moisture than that of New England, and that is the principal reason for its superior healthfulness in New England the dry air sucks the moisture out of man's air passages and he has the consumption. If he could breathe the moist atmosphere of the Pacific coast, he might recover. In their influence on consumptives I do not mean to say that the only difference between the Atlantic and the Pacific coasts, is found in the amount of atmospheric moisture. But I do say that this is one of the most essential sanitary differences. A man who, in New England, is ever suffering with dry and cracked skin, has in California moist and healthy skin. What is true of the skin is true of the lining of the lungs, with which the same air is in constant contact—the dry air sucks out the moisture and produces disease. All other things being equal the moister the air the healthier it is. Of course this law ceases to hold whenever the moisture becomes sensible, and the clothing thereby saturated. [Journal of a Traveler.]

AN EXTENSIVE MINING CLAIM.—The Placerville Democrat speaks of a Mining Company recently formed near Diamond Springs, which consists of 150 members, who claim 300 feet each, or about 9 miles of ledge for the entire company! The company is styled the "Black Quartz Gold-Silver and Copper Co.," and the ledge is pronounced by good judges one of a most promising character.

THE PIONEER MILL FOR REESE RIVER is now on its way thither, from Pike's Peak. It is an eleven stamp mill, and will be located near Clifton. Machinery, overland, from the East to the Pacific Slope mines is a new idea.

Messrs Buel & Dorsey of Clifton, are now on their way thither, or are already in this city, for the purpose of buying machinery to take to Reese River. We may soon expect some practical results from this newly discovered mining region.

**MINING INCIDENT.**—A few months since a gentleman, who keeps a restaurant in this city, but who at the time of the incident narrated below was keeping a similar establishment in Sacramento, was accosted in the street, by rather a sly looking individual, who frankly informed our restaurant keeper that he was *flat broke*, and hungry. Like a good Samaritan, as he is, the dispenser of edibles invited the stranger to make himself at home at his table until such time as he could get work. He remained with his benefactor several weeks and then left for the mines. Some months afterward the restaurant keeper received from the hands of a stranger, a third party, some certificates of stock in a quartz mine, in payment for his kindness to the stranger No. 1. The stock was then of but little value, and was laid aside for the time. Sometime afterward, having changed his business to this city, and noticing the growing interest in mining here, the restaurant keeper bethought himself of his Sacramento investment, made enquiry as to its value, and to his small astonishment, suddenly found himself in possession of mining property worth \$15,000. He had cast his bread upon the waters and it had returned to him many thousand fold.

#### TO MINERS AND PROSPECTORS.

In view of the frequent accidental discoveries of valuable mineral deposits, other than gold, in almost every section of the State, which have of late been made, it is but reasonable to suppose that prospecting even in California, has but just commenced. The simplest and most universal of all taliferous deposits is gold. It rarely occurs in any other form than that of "free gold" which is readily discernable to the naked eye. An examination of any rock or earth for gold is an extremely simple process. If its presence is suspected in alluvium, the simple washing of that alluvium in a pan is an invariable test. If in rock of any description; or in rock pounded fine in a mortar and washed, in the same manner as alluvium, will usually expose its gold to the naked eye, if there is any there in paying quantity. The only exceptions, are where the gold is contained in iron pyrites, copper pyrites containing also iron. In either of the latter cases the presence of gold may be readily ascertained by placing the pyrites in any suitable vessel and heating the contents at a moderate heat for from four to six hours, with frequent stirrings, by which means the sulphur will be evaporated, and the copper, if any is present, changed to a dull red color, and the gold retaining its natural appearance, on subjecting the whole to the usual panning process, may be readily seen by the naked eye. Not so with other metals. Silver, copper, zinc, nickel, and many others appear in such a great variety of metalliferous forms as generally to defy all but the most practical and scientific eye. No description of these ores can be given which will afford any very important aid to the inexperienced in making explorations. After reading descriptions, however, and carefully examining the specimens described, the explorer may go out and search with some degree of confidence and intelligence. A study of the characteristics of the sulphuretted ores alone, would lead an explorer to pass over, entirely unnoticed, the richest varieties of the ores known as Chlorides or Horn Silver, which, from the facility with which they may be worked, and their usual richness, are generally considered the most valuable of silver ores. There is much reason to believe that this variety of silver ore will be extensively found in all the volcanic regions of this State. So with many other ores.

Considering the great difficulty, in the present lack of cabinet collections, and other means of instruction, to acquire a practical mineralogical and geological education in this State, and desirous to aid, to our fullest capacity, the development of our mineral resources, we hereby make an offer to miners, prospectors and all others, who in their travels or explorations may come across specimens having the appearance of rarity or value, to carefully examine and announce upon the same, free of charge, as to their characteristics, value, etc., whenever any such specimens are brought or sent to this office free of cost to us. We have already been called upon in many such cases, and we shall at all times be willing to give our attention to any such requests which may be presented to us.

Our object is to furnish the miners of California with every class of information which shall be valuable to them in

the progress of their calling and in the development of the mineral resources of the State, and we know of no way in which we can devote a portion of our time more to the interests of miners than in the manner here proposed. The only equivalent we ask is that they shall do what they reasonably can to sustain and improve the paper devoted exclusively to their interests.

In carrying out the plan we propose, every miner and prospector should be at all times on the lookout for any new mineral. The ordinary rocks with which the miner meets in his travels and labor, and which possess no mineral value are usually well known. Whenever a rock presents any unusual appearance in conformation, color or other characteristic, attention should at once be given to it. There is scarcely a piece of quartz or rock of a quartzose nature, which presents any uncommon appearance in texture or color that has not been thus modified by the deposit or intrusion of some mineral substance. If such rock is found upon or near a vein of quartz it should be carefully examined "in place," and if the cause of its peculiarity is not evident and readily seen, it should not be passed carelessly by. There may be value in it, although the gold may not shine there. We shall commence in our next issue a series of articles describing as accurately and as intelligibly as possible all the ordinary mineral substances which may be likely to come under the notice of the California prospector; and we have the promise also, at an early day—probably within a week or two—of a series of articles under the head of "THE MINER'S LABORATORY," which will be prepared especially for this paper by one of the most skillful metallurgists on this coast, and which will be found of great value to the mining public.

#### SAN FRANCISCO MINING NOTICES.

##### ASSESSMENTS LEVIED.

Assessments upon Mining Stocks have been levied as follows:—

Garabaldi.—Assessment of \$1 per share, levied March 2nd.

Sutro.—Assessment of \$1 per share, levied Feb. 23, payable March 23.

Silver Quartz Mill Co.—Assessment of 5 per cent. levied Feb. 23, payable March 28.

Napoleon (copper).—Assessments of \$3 per share levied Mar. 3, payable in 30 days.

Golden Age.—Assessment of one dollar per share levied Feb. 24, payable March 26.

Washoe Gold & Silver.—An assessment of 2 per cent. on capital stock was levied Feb. 16, payable Apr. 1.

##### GINNINGS NOTICE

Coso Silver Mining Co.—The Office of this Company has been removed from the Stevenson House to Nos. 11 and 13 Court Block, No. 636 Clay street between Montgomery and Kearny. Entrance on both Clay and Merchant streets.

**SUBSCRIBE.**—Are you a miner and not a subscriber to the MINING AND SCIENTIFIC PRESS? If so, you are an annual loser of many times the price of a year's subscription, particularly if you are engaged in quartz mining. The same amount of practical information, important to miners and mechanics, which is contained in a volume of the PRESS, cannot be bought from the shelves of any bookstore in the country for the price of several year's subscription. Do you ever send a paper to the "Old Folks at Home"? If so, and you desire to send important information and valuable reading matter, you can find no paper that will be read with so much eagerness by them, or one that will convey to them so full an account of the real industry of the country as the MINING AND SCIENTIFIC PRESS. We invite all to send us their names and four dollars; or two dollars for six months, and become patrons of the only mining paper printed on the Pacific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examination, and with the hope that it may so far meet with their approval as to warrant their subscribing for it at once. It is not our usual custom to receive a subscriber for less than six months; but inasmuch as we are anxious to introduce the paper where it is not now known, we will, for the present, send the PRESS for three months even, on the receipt of one dollar, in coin or stamps. It is our belief that no one will wish to discontinue the paper after being a constant reader of it for even that short period.

## Minig and Scientific Press.

The MINING AND SCIENTIFIC PRESS is published at the Exchange Building, Room 27, corner of Battery and Washington streets San Francisco, Cal., at FIFTY CENTS per month, or \$4 per annum, in advance. C. W. M. SMITH and W. B. EWER, - - - - - Proprietors.

#### Engravings, Electrotypes, etc.

We execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEROTYPING and ELECTROTYPING, Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Files, Seals for Plain or Colored Printing. Job Work executed with dispatch at low rates. PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

#### To Printers.

AN INTEREST in one of the most flourishing and best paying Newspaper Offices in the mountains is offered for sale on easy terms. A rare opportunity is hereby presented to any printer desirous of establishing himself in a good business in one of the healthiest, most thriving and delightful mountain towns in the state. For further information enquire at this office.

#### MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

THIRD YEAR! VOLUME VI.—NEW SERIES!

A new volume of this extensively circulated paper commenced Sept. 11, 1862. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

#### The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

#### The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

#### The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

#### To Chemists, Architects, Millwrights and Farmers!

This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

#### Terms.

To mail subscribers:—Four Dollars per annum.

#### Club Rates.

Five Copies for Six Months, \$8.  
Ten Copies for Six Months, \$16.  
Ten Copies for Twelve Months, \$30.  
Fifteen Copies for Twelve Months, \$44.  
Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 80 Names can be sent in at different times and from different Post-offices Specimen copies will be sent gratis to any part of the country.

#### EWER & SMITH, Publishers,

Room 27, (formerly) U. S. Court Building, Corner of Washington and Battery streets, San Francisco.

#### Our Mint, its Rules, Charges and Operations.

##### For parting silver from gold when gold

is below 300-1000ths. fine ..... 3cts per oz.  
" from 300-1000ths. to 750-1000ths fine. 7 cts " " oz.  
" " 750-1000ths to 950-1000ths " 14 cts " "

##### DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce 1/2 per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300 3cts. per oz. gross weight  
301 " 500, 7cts, " " "

##### DEPOSITS FOR FINE BARS.

\$1 16-4-11ths cents. per standard ounce, 1/2 per ct. gross value of silver for making bars; also when gold is contained 1/2 per ct. on gross value of gold for coining. Refining charges as in purchases.

##### BARs SOLD FROM REFINERY.

\$1 21cts. per standard oz. 1/2 per ct. gross value to be added for making bars.

##### DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz. 1/2 per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

##### DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz. 1/2 per ct. gross value of deposit for making bars.

## PROGRESS OF THE MINING INTEREST.

We still continue our notes of Mining Progress. There appears to be no diminution of interest in mining operations, but rather an increase, and a more general desire than ever to invest. New discoveries and new developments in old workings are constantly being made. In the excitement consequent upon such a state of things it is gratifying to notice a growing disposition, among outside operators, to observe more caution in their investments. One of the first things to be required by that class of buyers is that the stock which they purchase should be controlled by a regularly incorporated company, whose officers and chief managers should be well known as men of integrity. Care also should be taken to learn the actual condition of the mine, the extent to which it has been developed, the character of its title, whether disputed or perfect, etc. There is no need to be rash or in haste to invest. Opportunities for good investment will increase monthly, and yearly for many a generation to come. Quartz mining is very different from placer mining; for while the latter may soon be skimmed over, and the richest workings exhausted, the former will be likely to improve for decades if not for centuries. The cream of the quartz mining business in California and the adjacent territories is yet far in the future.

## VIRGINIA DISTRICT.

The COLE is running a new tunnel to strike the lode at a depth of 575 feet. They are already in 150 feet. This company, we believe, has the deepest shaft in the Territory. Their main shaft reached a depth of 365 feet some two or three months ago, since which time we presume the work has still been continued upon it. Some very excellent silver bearing rock was taken from this shaft at a depth of 340 feet. The next deepest shaft in the Territory is on the Hale & Norcross ground, and is only some 40 or 50 feet less than the Cole.

The DANE is taking out ore from a 20 foot shaft.

The DUNN has recently struck very good rock, which, at last accounts was improving as the work progressed.

The SCORPION have driven their tunnel to a distance of 625 feet, and are expecting to reach their lode inside of 100 more. The depth at which they will strike it will afford a good test of its value.

The CHARLES CANEY have a good vein in their engine shaft at a depth of 56 feet. They have a 25-horse power engine now on the ground and in process of erection.

## GOLD HILL.

Very interesting and important developments have been for some time in progress in and about Gold Hill, and a large share of attention is being turned in that direction; every day, almost, brings something new from that locality.

The BELCHER, (which was noticed in our Washoe correspondence of last week,) in consequence of new developments, has advanced within the two weeks past from \$50 to \$450 per foot. The mine, at last accounts, wore a most promising aspect for even larger advances.

The KELOGG, BALL & Co's claim of 85 feet and "Bob. Aples" interest of 75 feet, the two next adjoining the Belcher will lose none of their value by reason of this "strike." The latter, indeed, is already improving in appearance, at the mine.

The OVERMAN Co., the third from the Belcher, comprising 1200 feet, has united with the Apple Co. in sinking a joint shaft on their dividing line, which, it is intended shall be equal in workmanship to anything of the kind in the territory. It will be 12 by 5 feet in the clear, lined with 3-in plank, and constructed in three compartments—two for cars, and the other for the pump; this shaft has reached a depth of 100 feet, and is intended to connect with the Overman tunnel, which is in 750 feet, and will not be completed much before the shaft is ready for it; the tunnel will drain the ledge 234 feet below the surface. Mr. Apple was offered \$600 a foot last week, and the Overman was held at \$80.

The LA MOTTE made a rich strike in their lower tunnel, on the 23d ult, in consequence of which their stock suddenly advanced from \$15 to \$70 per foot. This Company's tunnel was only recently commenced, and runs in on the length of the ledge, from Bower's ravine, at Gold Hill; it is said

the lead is thirty feet wide and the pay streak recently struck about twelve inches wide. There are 1200 feet in the claim. The Company was incorporated on the 14th of March last.

The GOLDEN GATE.—The shaft of the Golden Gate Company, on the divide between Virginia and Gold Hill, has reached a depth of 140 feet, and numerous small spurs, or feeders to the ledge have been cut through, which much resemble the Gould & Curry. What was supposed to be the main lead was passed through some time ago; it was about twenty feet wide, but contained no mineral of any consequence. The shaft will be continued to a depth of 300 feet, and a drift run to the ledge, when the share holders will be able to arrive at a fair approximation to the value of their mine.

## DEVIL'S GATE DISTRICT.

The ALAMO are taking out rock, averaging about \$50, from a 60-foot shaft. Their rock is crushed by contract.

SOUTH HADLEY.—This Company has struck the lode at a depth of 60 feet.

## FLOWERY DISTRICT.

The ROGERS, one of the oldest locations in this district, have run their tunnel 560 feet, and are now putting down an additional shaft. This company has a steam mill in operation, with 10 stamps, running upon custom work.

## ESMERALDA.

The work of development is still progressing finely in this region. Tunnels are being run and projected in every direction, where surface indications point to rich minerals below. Tunnel Enterprises, indeed, seem to be a feature in Esmeralda and evince the confidence which holders have in the "feet" that they have located.

We have heretofore, through our Esmeralda correspondence, given a pretty full account of most of these undertakings. A new enterprise of this description has recently been undertaken which is quite fully described in the *Star* of the 25th ult, from which we condense:

The STANFORD TUNNEL just being commenced is one of the best mining enterprises ever started in this District. It is located on the western side of Silver Hill and about a quarter of a mile above the American. The Company are composed of staunch business men in Sacramento and San Francisco as well as old experienced quartz miners here.

The President of the Company is Governor Stanford, Secretary, Newton Booth, of Sacramento, where the transfer office is kept.

The Tunnel when completed will be three thousand feet in length and will embrace all the blind ledges for two hundred feet on each side of it. A handsome cut has been opened from eight to twelve feet wide and fifty in length; the present contract is being completed under the Superintendency of Mr. A. E. Libby.

The company have a good location for a large mill, the erection of which will soon be commenced. The Tunnel will strike the Utah and all those rich ledges which cluster and run together on that side of the hill, reaching them at a depth of eight hundred feet, together with all the rich blind ledges which they are bound to strike. They are already taking out rich boulders which will pay for crushing, and as fast as they take them out they break them to pieces and pile them up. Success to the Stanford Tunnel.

NEW ROCK DRILLING MACHINE.—Think of using diamonds to cut rocks with! But an instrument for boring into hard rock, made out of a tube furnished with a circular cutter of rough diamond, is now being employed in France. It is caused to revolve, and, as it enters the stone, the cutter scoops out a cylinder, which is afterward easily taken out of the tube. Holes in hard granite, for blasting purposes, two inches in diameter and four feet deep, are thereby bored in one hour. This would require two day's work in the ordinary way. The diamonds, when examined through a magnifying glass, do not look at all injured.

MOUNT SHASTA OVERTOPPED.—Mount Shasta has hitherto been considered the highest peak in the United States. A recent measurement of Long's Peak, in Colorado, however, proves that mountain to be 14,470 feet above the level of the sea, or thirty feet higher than Mount Shasta.

A MATCH factory is in successful operation at Petaluma.

MINERALOGICAL.—We would call the especial attention of such of our readers as are not acquainted with Mineralogy, but who desire to obtain so much knowledge of that interesting science as may be requisite, to enable them to pursue, with a fair degree of confidence, the ordinary service of prospecting for minerals, to the series of articles which we have commenced in another column, under the head of the "Miners' Laboratory." These articles will be found very valuable to all miners, and will afford sufficient instruction in the general principles of mineralogy, including the use of the blow-pipe, and qualitative assaying, to enable any person to arrive at an approximately correct conclusion with regard to the general characteristics of such minerals. The number which we give this week may seem devoid of interest, or special value, but its careful study is indispensable to any proficiency in this department of knowledge.

We have been induced to prepare and publish this series of articles in consequence of the absolute lack of any books of instruction on this coast from which the information we prepare may be obtained. Miners will do well to either file the papers containing them, or cut out the articles and file them away as scraps. The series will be regularly numbered.

## REMARKS

Quite a large amount of business has been done in the mining share market during the past week, and generally at improved rates. The advances have mostly been based upon actual developments and improvements at the mines. Several instances of important fluctuations have been noticed, produced mostly through speculative operations.

Ophir and Gould & Curry have both been inactive during the week. The former has remained quite firm at about last week's quotations, while the latter has advanced about \$100, remaining firm at \$3600. We neglected in our last to notice the payment of another monthly dividend of \$100 to the foot by the Gould & Curry.

The chief transactions of the week in Virginia Stocks have been confined to the Chollar, Daney, Burning Moscow and North Potosi.

The Chollar has been steadily advancing for the last two weeks. During that time it has gone up from the depressed figure of \$560 to \$505.

The Daney still continues active, but at lower rates than the week previous. This depression has been caused in part by the fact that the last re-

from the mill have not been quite so favorable as those of previous weeks.

Burning Moscow has been considerably dealt in at improved rates. We quote as high as \$177½ cash and \$210 b 30.

North Potosi has been more active than usual, though at slightly depreciated rates.

Potosi is firm at considerable advance, with more buyers than sellers.

Mount Hope, adjoining the Potosi is beginning to attract considerable attention. They have a fine, well defined ledge, at a depth of 160 feet. This line will soon be thoroughly opened. We quote at \$140 @ \$48.

Charles Caney has declined slightly and is less active. The Company has good vein at a depth of 60 feet, and steam power about going into operation.

El Dorado has been more active than usual during the week at largely advanced rates, caused by their success in striking a good vein in their lower tunnel, on Monday last.

#### HUMBOLDT AND REESE RIVER.

Humboldt and Reese River Stocks are beginning to attract attention in this market. Sheba is held firm at about \$500, with but little in the market. De Soto is equally firm at \$10. The principal stocks from the Humboldt District known in this market are the Sheba, De Soto, Schuykill, Ben Franklin, Golden Age Series, Moonlight, Magna Charta Series, Peerless, Rose Whitman and Fort Pitt. There are doubtless others, perhaps more valuable, which have not yet generally become much known here.

From Reese River we have most favorable reports, and important results are confidently looked for, as seen as the mills under contract and in contemplation shall be put in motion. The Governor Seymour, Union, Harter and Honest Miner have each a quantity of ore now on its way to this city to be tested here by machinery, in working quantities. Assays from these claims are high; but the only satisfactory results are those obtained on regular working machinery. We shall await these results with much interest, and give them to our readers at the earliest moment.

#### ESMERALDA.

The Wide West has not yet recovered from the depression caused by the late unexpected assessment, although it is said the Company's mill is working with most satisfactory results. Three hundred pounds of unsorted malgams are reported as the result of one week's run of ten stamps. Antelope is improving, also the Real del Monte.

Silver Hill continues active at materially improved rates. We quote today as high as \$75 cash, \$14 advance on the highest rates of last week. Josephine and Willow Springs in the Coso district still remain active at previous quotations.

#### THE COPPER INTEREST

is still improving in favor and enhancing in value. New "Strikes" and important developments are daily reported. Indeed, on this side of the mountains, copper is a decided favorite over both gold and silver. Its value in "feet," however is not yet fully appreciated among speculators on Montgomery street. The mines exist, nevertheless, and the work of development is being pushed with a vigor never excelled in any previous mining operations on this coast.

#### WASHOE STOCK REMARKS.

For the week ending April 30, 1863.

There has been no lack of excitement in the Stock Market, during the past week. A general improvement has been noticed in most Stocks, and important advances in a few. Gold Hill still presents the chief field of attraction. The developments in that quarter are of a most exciting character, and the tendency of all Gold Hill Stocks of established value is upward. This point is beginning to divide the honors with Virginia City. We have full reports of the market to Monday Evening.

The Enterprise of Monday, April 27th, remarks as follows of the Leon and Koh-i-noor—

The Leon and Koh-i-noor, the latter claiming what is known as the Belcher ledge, have been the rage to-day among the Gold Hill claims. The

Leon adjoins the Belcher ledge on the north, and its advance in the market has been unprecedentedly rapid, even in this country of fluctuations. Six weeks ago it could have been bought for \$1 per foot; four days since it was selling at \$30 @ 32; to-day it is marketable at \$175 @ 200, with an upward bent. The Koh-i-noor is rapidly gaining in favor, and may be quoted at \$200 @ 250.

Overman has met with a material advance during the week. Starting at \$45 @ 60 on Monday, it reached \$75 on Wednesday, advanced to \$100 on Thursday and was quoted at \$150 to 165 on Monday April 27th.

Belcher is still in high favour. This Stock has gone up within about two weeks from \$50 to \$550 and \$800. The developments in this mine are of the most gratifying character. Were the ledge from which the ore is now taken through the works of this company without dispute, it would very soon command a first-class price in the market. There was some further excitement touching the Belcher, on Thursday last and it may be quoted at \$600 per foot.

Bullion was largely dealt in the first of the week to fill extensive orders. On Thursday it had advanced somewhat, and was quoted at \$45, 30 ds. On Monday last it was still in lively demand at \$55 @ 60. Our Washoe Pony Report, dated Thursday last, quotes a still further advance to \$85.

The Princess has been quite a sharer in the animation of the past few days. It was only in quiet request at the commencement of the week, some uneasiness being felt with regard to its suit with the Yellow Jacket. On Thursday the report of a probable compromise with their suit, added to the favourable appearance of the mine, improved the feeling with regard to it, and on Monday we find it quoted at \$45 @ 60. On Wednesday last it had advanced \$60 @ 65.

The Union has also been a sharer in the excitement. It was sold on the morning of Monday at \$25 to 27. Exciting reports coming in from the mine it was soon in lively request at \$45 @ 60, at which figures it closed the week.

Yellow Jacket has experienced considerable fluctuation. It commenced the week at \$375, and gradually advanced to \$525 @ \$530 on Thursday and closed at \$475 @ 495. Our Pony Report of last Thursday leaves it at \$510. The transactions have been quiet.

The El Dorado which had been quiet during the first of the week began to come in for a considerable share of attention with the indications of a near approach to the lead in their lower tunnel. On Saturday it was quite lively at \$75 @ 80. On Monday last they struck their ledge, and holders were still at a large advance over previous quotations. Our Pony Report of Thursday quotes it at \$130 @ 140—an evidence of a good ledge at that depth.

The Birdsall, adjoining the El Dorado on the south, was materially influenced by the advance of the latter, and is tending rapidly upward. It was quoted on Monday at \$65 @ 70, with little in market. This is an advance of \$25 over previous quotations.

Belvidere has advanced within the past week from \$20 to 55, probably through sympathy with the Chollar and Potosi.

Sacramento, which was languishing during the week previous, rallied on Monday last, and was quoted at an advance of \$2½ @ 4.

Badjazzet & Golden Era has fluctuated greatly during the week. It was considerably dealt in on Thursday, opening at \$30, it advanced to \$45 @ 50 and declined at night to \$30 @ 35. It was still declining on Monday and now remains at previous quotations.

Gold Hill, Nos. 1, 2 & 3, were in high demand on Monday. On Tuesday they were quoted as follows—No. 1, \$525 @ 550; No. 2, \$350 @ 375; No. 3, \$175 @ 200 and No. 4, at \$160 to 175.

We refer to our stock list and Washoe letter for further and later information by Pony.

#### VIRGINIA CITY, THURSDAY, APRIL 30, 1863.

This disposition manifested on the part of capitalists to invest in Washoe Stocks during the past week has been unparalleled in the history of this country. Even the wild fear of the spring of sixty presented less activity in Nevada stocks than the present week. However, operations are made with a greater degree of caution and more general surety of success. The developments continually being brought to light are of such character as would seem to warrant almost any reasonable investment. The ore taken from the Koh-i-noor or Belcher is quite equal to that of the Ophir or Gould & Curry and the ledge appears not less formidable.

# Volcanic Smelting Furnace.

PERSONS DESIRING INFORMATION AS TO THE USE of a economical properties of this Furnace, and its ability to make use of the same, when satisfied of its superiority over all other means of reducing ores and treating metals from the sulphurets, can obtain all the explanation and advice in regard to the same, and terms of sale of rights to use the same, on application to J. D. Stevenson or T. Ogg Shaw, or by letter to the proprietress through the Post Office of San Francisco. Drawings may be seen at the office of Col. J. D. Stevenson, 614 Merchant street, or at the office of T. Ogg Shaw, Brannan's Building, Montgomery street.

The time required for reducing ores by this Furnace from three to eight hours, and the amount of fuel only one-tenth as much as is consumed by other processes.

The process of condensation is applied to this Furnace which will save all those portions of precious metals which usually escape in a volatile form.

The attention of all interested in the subject is requested to examine the important results obtained by this process.

Parties wishing will be allowed to erect a trial Furnace of a capacity for smelting one ton of ore or more, on giving an obligation to pay the usual fee for the right to use it, should they continue to make use of the invention for a longer period than two months.

mech 16 MRS. E. J. HALL, M.D., Proprietress.

# New Style of Lady's Buckle.

W. BOHM, INVENTOR & PATENTEE

THE SUBSCRIBER HAVING OBTAINED LETTERS PATENT from Washington for an improvement in the construction of Ladies' Buckles, is now ready to furnish the same in every variety of style. This buckle possesses several very important improvements over any her in use.

The invention having been carefully examined at the Patent Office, has been adjudged to be a useful improvement, and Letters Patent have been granted for 17 years, exceeds all other buckles in

## Usefulness, Strength and Appearance.

The Public is respectfully invited to call and examine this Buckle at the Jewelry Establishment of

BRAVERMAN & LEVY,  
621 Washington Street, San Francisco.  
JOSEPH H. BROTHERS,  
607 Montgomery Street, San Francisco.  
FLOBERG & CONRAD,  
118 I Street, Sacramento.  
Agents for the Patentee.

Every Buckle sold will be guaranteed as to its Strength and Durability.

W. BOHM, Patentee.

## READ THIS!

COAL OIL EXPLOSION.—ON SATURDAY EVENING, while Mr. Brewster was engaged in the Summer Street House in pouring coal oil from one can to another, his wife imprudently approached with a lighted candle and the oil exploded. Mrs. Brewster's arms were badly burned, as were also the husband's hands. However, he succeeded in mastering the flames, and preventing worse consequences.—[Evening Bulletin, Aug. 4.]

## A Branch Telegraph Office,

Connecting with all the lines throughout the country.

LEWIS LELAND & Co.,

Proprietors.

San Francisco, Jan. 1st, 1863.

# John R. Sims,

Oregon street, between Washington and Davis and Front and Jackson streets, SAN FRANCISCO.

Manufacturers of Fire Proof Doors and Shutters, Bank Vaults, Grating, Cemetery Railings. All orders from the interior Oregon, Washington Territory, Vancouver's Island, British Columbia, or any place on the Pacific coast, attended to with promptness and dispatch.

Mr. Sims Appreciates the Past liberal patronage of his friends, and trusts that he may continue to merit it in the future.

## For the Information of Strangers

he would say that he feels confident that his experience in his particular calling is surpassed by none on this coast, which his superior work, sent to almost every town in this state, Oregon, also Victoria and the Sandwich Islands, and to be seen on some of the best buildings in San Francisco, fully attest. A large assortment of second hand shutters for sale at low rates. ap13

## To Mill Owners.

WANTED, by a person fully competent to the position, a situation as MINING SUPERINTENDENT in a Gold or Copper Mine. The Applicant was engaged for about eight years as Superintendent of Copper Mining Works in Cornwall, and has acted in the same capacity in Gold Mines in this State for the past seven years. He has had much experience in Cornwall, as an assayer, a Machinist, a Draughtsman, a Surveyor and an Assayer of Copper Ore. He can give ample testimonials as to his capacity for the position he seeks.

Apply at this Office.

# W. T. & J. GARRATT,

## City Brass and Bell Founders

Cor. First & Market sts., San Francisco.

BABBET METAL CASTINGS, FIRE ENGINES, FORCE and Lift Pumps, Church and Steamboat Bells, Tavern and Hand Bells and Gongs, Hose and all other joints, Gauge cocks, Cylinder cocks, Oil Globes, Steam Whistles, HYDRAULIC PIPES and NOZZLES for MINING PURPOSES, Iron steam pipe furnished with fittings, &c.; COUPLING JOINTS of ALL SIZES. Manufacturers of "Garrett's Patent Improved Journal Metal."

# SQUARZA'S PUNCH.

## FIRST PREMIUM

AT THE SACRAMENTO AGRICULTURAL STATE FAIR

FOR 1862.

## ALSO; FIRST PREMIUM

At the San Francisco Bay District Agricultural Fair, 1862

MANUFACTORY, WHOLESALE AND RETAIL,

No. 44 Leidsdorf street,

Opposite the What Cheer House, San Francisco.

## LATEST IMPROVEMENT

## in Ladies' Buckles.

MR. REICHEL RESPECTFULLY ANNOUNCES TO THE Ladies of this State, as well as to Jewelers and dealers in Jewelry, that he has made important improvements in BUCKLES, which surpass any and all heretofore made. Their simplicity, commodiousness, and beauty render them the most useful as well as ornamental trinkets.

Orders from the country respectfully solicited. For particulars call at or address, FREDERICK REICHEL, Manufacturing Jeweler, 620 Merchant street, San Francisco.

# GREAT REDUCTION IN PRICES.

## STANFORD BROTHERS,

121, 123 and 125 California street,

Keep the Largest Stock of all Kinds of

TANNERS OIL, ETC.

Our customers in particular, and the country trade generally, are requested to ascertain our prices before purchasing from traveling agents, as we will sell at less rates than they can afford to. ap16tf

## 50 lbs. MARINE AND

## Fire-Proof Paint,

MANUFACTURED BY THE PACIFIC METALLURGICAL Works in this city, for Hulls and Decks of Vessels, from ground Mineral Rock contains Arsenic, Copper, Litharge and six other Minerals. When used on the Decks or Bottoms of Ships, it is equal to a coat of Stone, and quite equal to Copper, no worms will ever effect it, and cheaper than any other paint.

## DIRECTIONS:

For Decks of Ships, use two parts Mineral Paint, one part White Lead, mix with Linseed Oil.

For Bottoms of Vessels, use one part ground sulphur three parts Mineral Paint, mix with Coal Tar and apply it hot.

For sale by all Ship Chandlers and Trademen, in boxes of 50 lbs. each, or by the Pacific Metallurgical Works.

## 25 POUNDS FIRE-PROOF PAINT.

When used on Roofs, Buildings, or Fences, it is equal to covering them with a coat of Stone, being perfectly Fire Proof, and costing less than any paint.

## DIRECTIONS:

HOUSE.—Mix three parts Mineral Paint with one part white lead, thin with Linseed oil: if a lighter color is wanted, mix less paint, more lead.

ROOF.—Five parts of Mineral Paint, one part white Lead; mix with Linseed oil. Put it thick on a tin Roof as one coat when properly applied will last three years.

S. C. BRADSHAW, Agt.,

G. T. FORQUE, Superintendent.

WORKS, North Beach; Office, 318 California st., San Francisco.

## WRIGHT'S PICKS.

JOHN WRIGHT, of Sacramento, has established himself in San Francisco for the manufacture of every description of PICKS, of the best material, at reduced prices. PICK EYES of the best iron furnished in any quantity, at low rates. Orders from the country promptly attended to. N. B.—None genuine unless stamped with my name. JOHN WRIGHT, 511 Market street, Opposite Battery, San Francisco.

## REMOVAL.

OFFICE OF THE PACIFIC METALurgical Office is removed to 318 California street. Having enlarged our Works at North Beach, we are now enabled to reduce from 10 to 15 tons of Silver or Gold rock per day. Gold and Silver ore, and Sulphuret Assayers', or Silversmiths' sweepings reduced or purchased. COPPER ORES.—Highest market rates advanced in cash, for shipments. S. C. BRADSHAW, Agent, 318 California street, near Sansome.

## SPECIAL NOTICES.

**Office of the Nevada Copper Mining Co.**  
March 24, 1863.—At a meeting of the Board of Trustees, held this day, an assessment of Forty Cents per share was levied upon the Capital Stock of the Company, payable twenty (20) cents per share within thirty days, and twenty (20) cents per share within sixty days from this date, to the Secretary. By order of the Trustees,  
J. ARMSTRONG, Secretary.

**Office of the Tennessee Gold and Silver Mining Company, No. 7, Montgomery Block.**—At a meeting of the Board of Trustees held April 22, 1863, an Assessment of One Dollar and Fifty Cts per share upon the capital stock of said Company was levied, payable on or before Saturday, the 23d day of May, 1863.  
J. H. BLOOD, Secretary.  
San Francisco, April 27, 1863. [ma21]

**Office of the San Francisco Gold and Silver Mining Company, No. 7, Montgomery Block.**—At a meeting of the Board of Trustees, held April 20, an Assessment of One Dollar (\$1) per share on the capital stock of this Company was levied, payable on or before Thursday, May 21, 1863.  
J. H. BLOOD, Secretary.  
San Francisco, April 27, 1863. [ma21]

**Office of the San Patch Gold and Silver Mining Company, No. 7, Montgomery Block.**—At a meeting of the Board of Trustees held March 30, 1863, an Assessment of Fifty Cents, (50 cts.) per share on the capital stock of said Company was levied, payable on or before Thursday, April 30, 1863.  
J. H. BLOOD, Secretary.

**ANNUAL MEETING.**—The Annual Meeting, for the election of officers, of the SAN PATCH G. & S. M. Co., will be held at the company's Office, No. 7, Montgomery Block, on Monday, May 4, 1863, at 1 o'clock P. M.  
J. H. BLOOD, Secretary.  
San Francisco, April 22, 1863. [td]

**Schmeltzer Gold and Silver Mining Company.**—At a meeting of the Board of Trustees of this Company, held April 11, 1863, an assessment of 25 cents per share was levied, payable in United States coin, to the Secretary, at the office of the company, No. 500 Montgomery street, on or before FRIDAY, April 17, 1863.  
ap20-1m M. G. ELMORE, Secretary.

## To Mine Owners.

**PARTIES having a Good silver Mine** and wishing for Machinery to work it for an interest in the Mine Will do well to apply at this office. No organized company need apply.

## WHEELER'S

### Amalgamating and Separating Pans.

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of trituration, and in cleaning up. By the introduction of the Separating Pan to follow the trituration this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

\* \* These Pans can be seen in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves.  
no16-1f ZENAS WHEELER.

## Agency For Patents.

THE UNDERSIGNED having been long established in the Patent Agency Business, and having favorable arrangements for attending to the interests of inventors at the Patent Office in Washington, offer their services for the securing of Caveats and Patents also, will attend to the sales of Patent Rights, and to all matters connected with patented inventions.

# Mining and Scientific Press.

W. B. EWER,  
EDITOR.

A JOURNAL OF MINING, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

EWER & SMITH,  
PROPRIETORS.

VOL. VI.

SAN FRANCISCO, MONDAY EVENING, MAY 11, 1863.

NO. 28.

## SPECIAL NOTICE.

We wish it distinctly understood that all the interest which Julius Silversmith ever had in the MINING AND SCIENTIFIC PRESS, ceased in November of 1862. EWER & SMITH are now the publishers and proprietors.

## NOTICE.

With the present number, we forward bills to those of our subscribers whose names were handed over to us by the former proprietor of the Press. We have made out the accounts as we find them on the books, and will correct any errors which may be pointed out. We trust our interior subscribers will recognize the importance of an immediate attention to the matter. Subscriptions can be enclosed, in old coin, within a letter, and forwarded through the Post-office. All such letters should be "registered," when they are sent at our risk. When it is impractical to send the exact amount of the bills, we will give credit for whatever amount it may be convenient to forward, and will enclose receipt in next paper; or the exact amount may be sent in gold or silver coin through Wells, Fargo & Co's Express.

## CHEMISTRY.

No branch of science has made more rapid strides within the past twenty-five years than that of Chemistry. The discoveries in this science are yearly adding immensely to the industrial employments and productions of the world. The manufacture in the United States of articles strictly classed as chemical, exclusive of paints, varnish, white lead, perumes, cement, etc., amounted, in 1850 to about \$5,000,000. Since that time these values have been vastly increased; how much will not be known until the final publication of the census report for 1861.

This branch of science is yet but in its infancy, and is susceptible of almost unlimited extension, and application to the creation of useful articles, largely from the refuse of every other manufacture, but chiefly from the diversified products, vegetable, animal and mineral of our own and other lands. Many of the chemical branches, apart from the money value of their manufactures, are of the highest economical importance to our national industry.

Perhaps the most important of the results of Chemistry during the last decade has been those in connection with the manufacture of Petroleum. The late discoveries of immense deposits of this mineral oil, and the skill with which the chemist has manipulated it, has resulted in building up an entirely new, large and lucrative branch of business. Chemistry has as yet revealed but a tithe of the wealth of its vast resources.

CONNECTICUT TOBACCO.—About one hundred and fifty tons of Connecticut-river tobacco have recently been shipped from and above Hartford, through the agency of a Springfield man, to a house in New York, for the French Government.

## THE MEXICAN TRADE.

The short sightedness of our trans-mountain neighbors in their late legislative attack upon San Francisco capital seeking investment in Washoe, has resulted in turning much of the mining capital of this city into quite a new channel.

Although this unfriendly action proved inoperative, for the time, in consequence of its overleaping itself, it has nevertheless had the effect to so disturb the confidence of capitalists here, in the legislative action of that region as to induce a large diversion of capital into another direction, and into a region which, according to present appearances bids fair to prove an equal to Wa-hoe.

In striking contrast with the action of our neighboring Territorial Legislature, may be placed the liberal inducements which the Mexican Government is holding out to attract thither foreign capital for the development of its mines. The large amount of capital now seeking investment in Mexico will soon Americanise the northern border provinces, and bind them to us by the strongest of all ties, those of consanguinity and interest. The most casual observer of events cannot fail to notice the rapidity with which the new born trade with Mexico is growing into an importance of the first magnitude among our California commercial interests. The steamship line which, but a few months since, was put on as an experiment now finds it absolutely impossible to transact all the business which is crowding upon them. Every available space on board their ships is crowded with freight and passengers. Sailing vessels have also been put upon the route, but the demand for freight and passage is still in advance of present facilities. So great is this demand that unseaworthy vessels have been employed, and others so overcrowded with deck loads, that the insurance companies have refused their protection, until a portion of the same has been again replaced upon wharfs to await subsequent departures. The regular departure of these steamers is beginning to be looked upon with about as much interest, and attended with nearly as large crowds as the departures of the Atlantic steamers.

Many of our most prominent citizens and capitalists have embarked in the enterprise of re-opening these old mines. Among the departures by the last steamer, we notice the name of Judge Sherwood, one of California's Pioneers. He took with him men and machinery to work the Soyota Mine, in Sonora, of which he is Superintendent. The field of operations in this region is not less extensive than that upon the Eastern Slope, and is probably fully equal in value. Many of the Mines in Northern Mexico are known to be of extraordinary richness. They were opened and worked at a time when the knowledge of mining was exceedingly imperfect. The steam engine was a thing entirely unknown to the operators in the mines, and even the ordinary windlass was a labor saving invention, which if known to them, was entirely ignored, for we read that all the ore was packed out of the mine, up perpendicular steps by manual labor. When water was reached the mine was very soon abandoned. Notwithstanding all these drawbacks immense fortunes are known to have been extracted from these mines. Such being the facts we may reasonably expect most extraordinary

results from the introduction of modern improvements, and Yankee skill and energy. With these advantages we hazard but little in saying that this new field of mining enterprise will soon equal, if indeed it does not surpass any other mining field in the world, in productiveness. The Sierra Madre is one vast series of silver mines from South of Durango and Sinaloa to the dividing line between Mexico and the United States; while the Coast region and the Peninsula of Lower California is equally rich in both copper and silver. But a very few only of these mines have yet been opened; thousands are yet to be brought to light by the tireless exploring energies of the universal Yankee whose tide of emigration has now been turned in that direction.

All this region is destined to become commercially tributary to San Francisco. The channels of trade on this coast are as fixed as are the channels of our rivers. Legislation cannot alter them. Neither state lines nor international boundaries can turn them. The efforts of legislation in Nevada have but checked the flow of capital thither for a time, injuring that territory to the amount of millions, but really benefiting San Francisco, by causing an overflow of capital in a new direction and opening up a field, which might otherwise have remained fallow for years. San Francisco wishes no ill to Nevada, but rejoices as much in any degree of prosperity which may attend her, as she does in that which may attend any portion of the Pacific Coast. If Nevada wishes to develop her own mines with her own capital, it is well. San Francisco will seek other fields. We have them, both rich and in abundance. However and wherever communities may grow up on the Pacific Slope, physical and geographical conformations must so regulate the channels of their trade as to make this city the common centre and radiating point. There is not ten miles square of land from Central Mexico on the south to the northern line of the British Possessions, and east to the dividing ridge between the Atlantic and Pacific oceans, in whose prosperity San Francisco is not pecuniarily interested. Without a rival from the Equator to the North Pole, she sits in her glory the complacent and benignant queen of the entire Pacific Slope.

THE HESPERIAN.—The May number of this excellent monthly came duly to hand. It is filled with the usual variety of valuable and interesting matter, embellishments, etc., not forgetting the welcome paper pattern—welcome to the ladies, at any rate. The magazine is now under the Editorial charge of Mr. and Mrs. Strong, who are assisted by an able corps of contributors.

THE PACIFIC REVIEW for May, has also been received. This number is embellished with a most truthful and life-like portrait of Rev. Dr. Wadsworth. The Pacific Review is a periodical of which California may well be proud.

POST-OFFICE AT CLIFTON.—A Post-office has been established at Clifton, Reese River. People writing to their friends at Austin or Clifton, should address their letters to the latter place instead of Jacobsville.

PATENT GRANTED.—Mr. E. Elliott, of Petaluma, has received letters patent on a pump recently invented by him. This pump is said to be a most important invention.

## THE MINERS' LABORATORY.—NO. II.

We have already described a *mineral* as an unorganized body, formed and enlarged by an increase of particles, externally, said particles being attached by mere *juxtaposition* instead of *assimilation* as is the case with vegetable and animal organism. All solid substances therefore which possess neither vegetable nor animal life are *mineral*. All rocks, are minerals and the chief part of soils are mineral.

When a mineral has a metal of any kind associated with it, it is commonly called an *ore*—as an ore of silver, an ore of lead, copper, etc. Ores are usually found in veins, sometimes however in beds. A mineral bed usually lies horizontally, or at a very slight inclination. Lead, zinc and iron are often found in beds; gold, silver, copper, mercury, etc., very seldom.

## MINERAL VEINS.

We propose in this chapter to treat principally of *mineral veins*. A mineral vein may be described as a fissure or crevice in the earth, more or less vertical, and filled with some kind of vein-stone, usually quartz, more or less mixed or impregnated with various metals, and when so mixed called ores. Most metalliferous veins contain several varieties of metals. The veins of California and Nevada territory probably contain a larger variety of metals than those of any other portion of the globe. Veins vary in width from a fraction of an inch to one or two hundred feet. They usually range from 10 inches to two or three feet in width. Of the *origin* of veins and the manner of their being filled, there are various theories. The opinions of practical and scientific writers on this subject are quite various. Some attribute these fissures to a process of cracking or opening of the earth in long fissures by some interior power of upheaval; others attribute their formation to a contraction of the earth's crust in the process of cooling or crystallization; others again suppose them to result from the action of electrical currents. Their manner of filling up is also a matter of great diversity of opinion. Intrusion, sublimation, deposition, infiltration from water, electrical agencies, etc., are among the most commonly entertained theories. The probability is that all the agencies named have contributed at times and in part in a greater or less degree toward preparing these valuable deposits, so indispensable to the progress of civilization and the arts. Our present purpose, however, being to treat upon facts, we shall waive all theorising for the time being, and confine our remarks to simple facts and positive instruction. In future numbers we shall probably have something to say on the various theories above alluded to.

## GENERAL LAWS OF VEINS.

Whatever their origin these veins (or *lodes* as they are sometimes and perhaps more properly called) are, as a general thing, found to obey certain general laws. They are usually contained within clearly defined walls, and are generally found in "setts" or "classes," each individual of any given sett being approximately parallel to all others of its class. The different setts usually give evidence of different ages, the newest sett being found to have disturbed or displaced the older in passing across it. The different setts are usually known by the general line of their direction as the "East and West sett of veins" or the "North and South sett of veins." They are usually found most productive near their crossings, also at any point where the vein enters a new class of rock, a change in its mineral productiveness may be most confidently expected. The point where a "leader" or "string" comes in is usually improved by such contact. On the other hand a sudden enlargement of a lode, where it is not caused by the coming in of a feeder is almost invariably attended with comparative barrenness. The scattering of a lode into a number of small ones is also almost universally unfavorable. They are, of course, of more recent origin than the rock which they traverse, though their general characteristics and richness in mineral is often much affected by their passage from one class of rock to another. This latter fact would seem to imply that, to a certain extent, they are dependent for their mineral value upon the mechanical condition of the rocks which they traverse.

## TRUE VEINS.

As we have already stated veins or lodes are found traversing all kinds of rocks, stratified and unstratified, often passing from one to the other. They are also sometimes

found to traverse a space between two classes of rock, as between the slate and granite, metamorphic (rock changed by heat) and unchanged rock. Veins of this description are usually called "true veins," because they are much more reliable, more clearly defined, of greater linear extent, and generally much larger than veins having both walls composed of the same kind of rock. It is reasonable that these conditions should usually accompany veins of this description inasmuch as fissures between walls of dissimilar rock would naturally present less obstructions and disturbances and be more continuous in both length and depth, than fissures forced through a homogeneous mass of rock. True metalliferous veins are almost uniformly much more productive than other veins in the same neighborhood. The Comstock vein, in Washoe, is of this description. This is a condition in regard to quartz veins which should be more generally considered than has heretofore been the case in this country. It will, wherever it exists, be found to exert a most important influence on the productiveness and consequent value of the vein.

## IGNEOUS INDICATIONS FAVORABLE.

Valuable metalliferous veins of ore are often found in secondary and even tertiary formations, yet as a usual thing, they are found more universally productive and most reliable when they occur in the older and metamorphic rocks. We have the proof of this in our own state and adjoining territories. Those portions of California and the Eastern Slope, where is found the strongest evidence of ancient igneous action, have as a general thing proved most valuable in mineral developments. Indeed, the idea has been advanced by some, that no metalliferous veins exist entirely disconnected with igneous rocks. It is claimed by the advocates of this theory that whenever surface indications are wanting, metamorphic rocks will invariably be found at no great depth below.

## PECULIARITIES OF QUARTZ VEINS.

The study of quartz veins, to the mineralogist and miner, is most interesting and important, and one to which quite too little attention has been devoted in this country. In the hasty summary we are now giving we cannot do the subject that justice which its importance demands; but in future numbers we propose to come back to this head and treat more fully upon it.

Few veins exhibit their true characteristics upon the surface. The action of water and the atmosphere, resulting in the oxidation of much of their contents, and other disturbing influences upon and proceeding from the surface, not unfrequently lead to serious fallacies in judging of a vein in the early stage of its development. An important consideration in the study of veins is the changes which they undergo in their passage from one class of rocks to another. This matter, so far as we have learned, has never been much considered on the Pacific Slope, although it has long been acknowledged as one of much importance in nearly all other mining regions. We append the result of a few observations under this head from various authorities.

De la Beche in his survey of Cornwall says that granite and its modifications is always found near or at all localities productive of paying tin or copper mines; while lead, antimony, iron and zinc are found independent of and at a distance from granite.

In the Hartz mountains, veins passing from hard to soft slates lose much of their productive character; hard granites, as a general thing, are also found less productive than soft, or decomposed descriptions.

In the Copper mines of Lake Superior veins in hard greenstone are usually contracted and comparatively barren; but the same veins on entering the granular trap, a much more yielding material, become at once expanded, and improved in yield. This is especially the case with the celebrated Cliff and North American mines. The Copper Falls mine is highly productive and well defined in the trap, but on entering a belt of sandstone the vein is contracted to a mere fissure. Nearly all the veins of the Lake Superior region traverse different mineral planes, and in their passage through them are more or less modified, as noticed above. It will be perceived that instances above cited confirm the correctness of our previous remark with regard to the favorable nature of igneous rocks in mineral localities. We shall resume this subject in our next.

## THE SUPERHEATED STEAM PROCESS.

We have alluded once or twice to a process in operation in this city, for the extraction of gold by the use of superheated steam, and have witnessed the operation on several occasions. We understand that several of these machines have been ordered by parties who have thoroughly satisfied themselves with regard to the completeness of the process, and the machine will soon be subjected to a practical test both in Washoe and this side of the mountains. The process is the invention of Prof. Ryerson, of New York, a gentleman of large and practical scientific attainments, and is already in successful use in the mines at Pike's Peak. It is claimed by the inventor, and with good show of reason, that with the tailings from ordinary machinery a large amount of gold of the most minute microscopic fineness is constantly washed away, which can be readily taken up and saved by this machine. We can see no reason why every particle of liberated gold, however fine, may not be taken up by this process. We shall soon be able to give our readers the results of the practical trials to which the process is about to be subjected at the several points above alluded to.

THE BUSINESS OF GATHERING PITCH. We learn from Mr John Hart of this city, says the Marysville *Appeal*, that he has a large number of men engaged in tapping trees for pitch, in Butte county, the best points found yet being about two miles this side of Dogtown and at Nimshaw, four miles west of Dogtown.—He has eighteen thousand trees tapped, averaging two cuts or boxes to the tree, and making an aggregate of 36,000 boxes. His workmen are now cutting 500 additional boxes per day. Fifty-eight barrels of pitch of 42 gallons to the barrel have been brought to town thus far this spring, and from this time it is expected the average amount received will be 25 barrels per week.

EFFECT OF SHOT ON VESSELS.—A shot does not make a hole of its own size right through the wood, but indents it, the fibres springing back after the shock. Generally the course of a shot can only be traced with a wire, sometimes with a hole as large as a man's finger. The damage most often happens on the inside of the vessel, in splintering and breaking the wood, after the main force of the shot is spent. There is rarely an instance where a ship was sunk by a solid shot. Hot shot and shell do the mischief. This latter will sometimes make apertures of several feet through the sides of vessels.

SIZES OF STEAM CYLINDERS.—Much confusion and popular ignorance exists upon this point, and errors of statement are continually made respecting this or that steamship or boat. There are two vessels building in New York—one an iron-clad battery, the other a North river steamer; the iron-clad will have two cylinders each 100 inches in diameter by 4 feet stroke of piston; the latter vessel will have one cylinder 83 inches in diameter and 16 feet stroke of piston. The largest steam cylinder in any steamboat or steam vessel in this country, is 105 inches; the cylinder of the Metropolis—a Sound boat—is of this size, as are also those furnished to the Golden City (now building), and the Constitution belonging to the Pacific Mail Company; these vessels are the only ones that have cylinders 105 inches in diameter.

INTERESTING TO BOILER MAKERS.—According to the experiments made by Professor Fairbairn, the law of resistance for cylindrical tubes is this: A tube having the same strength of material, and being of the same diameter, will resist double the pressure to one of double the length; or collapsing power, other things being the same, varies inversely as the length and inversely as their diameter. Experiments made with elliptical tubes showed that in every construction where tubes have to sustain a uniform external pressure, the cylindrical is the only form to be relied upon, and that any departure from the true circle is attended with danger. The experiment also tend to confirm the conclusions heretofore arrived at, namely, that the strength of riveted joints of malleable iron plates are nearly as the numbers one hundred for the plate seventy for double riveted joints, fifty for single riveted joints.

Present indications point to a most abundant harvest throughout the State.

**THE ENGLISH IRON-CLAD FRIGATES**—Four of these vessels have returned from their experimental voyage to Portugal, and the naval report of the London Times says that the plates are loose, and that the vessels are not in a condition to go out to sea now. The impression of the writer seems to be that the fastening of iron plates to the wooden hull, will not answer the purposes desired. It appears as though our little fleet of Monitors were the most formidable iron-clad fleet afloat.

**TREASURE SHIPMENTS**—During the present year, up to the 30th ult., \$15,892,103 74 in treasure has been shipped from San Francisco, and for a corresponding period of time last year 10,864,760 92 was shipped—showing an increase of exports for the present year of over 5,000,000.

**A POWERFUL SHIP**—The Royal Oak, an iron-cased ship, is reported to be ready to leave Chatham, England, early next month. Her engine is of 800 horse power, and she is completely covered with four and a half inch armor, and has a turret shot proof, whence the captain directs all operations by means of Gishorn's telegraph, which communicates with the engine-room and steering apparatus. Her armament consists of 32 68-pounders, and two Armstrong 100-pounders; and the bow is constructed so that she can be used as a ram.

Within the last year over \$8,000,000 in gold dust has been received at the New York assay offices from Pike's Peak.

#### TO MINERS AND PROSPECTORS.

In view of the frequent accidental discoveries of valuable mineral deposits, other than gold, in almost every section of the State, which have of late been made, it is but reasonable to suppose that prospecting even in California, has but just commenced. The simplest and most universal of all metalliferous deposits is gold. It rarely occurs in any other form than that of "free gold" which is readily discernable to the naked eye. An examination of any rock or earth for gold is an extremely simple process. If its presence is suspected in alluvium, the simple washing of that alluvium in a pan is an invariable test. If in rock of any description; that rock pounded fine in a mortar and washed, in the same manner as alluvium, will usually expose its gold to the naked eye, if there is any there in paying quantity. The only exceptions, are where the gold is contained in iron pyrites, or copper pyrites containing also iron. In either of the two latter cases the presence of gold may be readily ascertained by placing the pyrites in any suitable vessel and keeping the contents at a moderate heat for from four to six hours, with frequent stirrings, by which means the sulphur will be evaporated, and the copper, if any is present, changed to a dull red color, and the gold retaining its natural appearance, on subjecting the whole to the usual panning process, may be readily seen by the naked eye.

Not so with other metals. Silver, copper, zinc, nickel, and many others appear in such a great variety of metalliferous forms as generally to defy all but the most practical and scientific eye. No description of these ores can be written which will afford any very important aid to the inexperienced in making explorations. After reading descriptions, however, and carefully examining the specimens described, the explorer may go out and search with some degree of confidence and intelligence. A study of the characteristics of the sulphuret ores alone, would lead an explorer to pass over, entirely unnoticed, the richest varieties of the ores known as Chlorides or Horn Silver, which, from the facility with which they may be worked, and their usual richness, are generally considered the most valuable of silver ores. There is much reason to believe that this variety of silver ore will be extensively found in all the volcanic regions of this State. So with many other ores.

Considering the great difficulty, in the present lack of cabinet collections, and other means of instruction, to acquire a practical mineralogical and geological education in this State, and desirous to aid, to our fullest capacity, the development of our mineral resources, we hereby make

the offer to miners, prospectors and all others, who in their travels or explorations may come across specimens having the appearance of rarity or value, to carefully examine and pronounce upon the same, free of charge, as to their characteristics, value, etc., whenever any such specimens are brought or sent to this office free of cost to us. We have already been called upon in many such cases, and we shall at all times be willing to give our attention to any such requests which may be presented to us.

Our object is to furnish the miners of California with every class of information which shall be valuable to them in the progress of their calling and in the development of the mineral resources of the State, and we know of no way in which we can devote a portion of our time more to the interests of miners than in the manner here proposed. The only equivalent we ask is that they shall do what they reasonably can to sustain and improve the paper devoted exclusively to their interests.

In carrying out the plan we propose, every miner and prospector should be at all times on the lookout for any new mineral. The ordinary rocks with which the miner meets in his travels and labor, and which possess no mineral value are usually well known. Whenever a rock presents any unusual appearance in conformation, color or other characteristic, attention should at once be given to it. There is scarcely a piece of quartz or rock of a quartzose nature, which presents any uncommon appearance in texture or color that has not been thus modified by the deposit or intrusion of some mineral substance. If such rock is found upon or near a vein of quartz it should be carefully examined "in place," and if the cause of its peculiarity is not evident and readily seen, it should not be passed carelessly by. There may be value in it, although the gold may not shine there. We shall commence in our next issue a series of articles describing as accurately and as intelligibly as possible all the ordinary mineral substances which may be likely to come under the notice of the California prospector; and we have the promise also, at an early day—probably within a week or two—of a series of articles, under the head of "THE MINER'S LABORATORY," which will be prepared especially for this paper by one of the most skillful metallurgists on this coast, and which will be found of great value to the mining public.

#### NOTICE.

**Coso Silver Mining Co.**—The Office of this Company has been removed from the Stevenson House to Nos. 11 and 13 Court Block, No. 636 Clay street between Montgomery and Kearny. Entrance on both Clay and Merchant streets.

**SUBSCRIBE.**—Are you a miner and not a subscriber to the MINING AND SCIENTIFIC PRESS? If so, you are an annual loser of many times the price of a year's subscription, particularly if you are engaged in quartz mining. The same amount of practical information, important to miners and mechanics, which is contained in a volume of the PRESS, cannot be bought from the shelves of any bookstore in the country for the price of several year's subscription. Do you ever send a paper to the "Old Folks at Home?" If so, and you desire to send important information and valuable reading matter, you can find no paper that will be read with so much eagerness by them, or one that will convey to them so full an account of the real industry of the country as the MINING AND SCIENTIFIC PRESS. We invite all to send us their names and four dollars, or two dollars for six months, and become patrons of the only mining paper printed on the Pacific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examination, and with the hope that it may so far meet with their approval as to warrant their subscribing for it at once. It is not our usual custom to receive a subscriber for less than six months; but inasmuch as we are anxious to introduce the paper where it is not now known, we will, for the present, send the PRESS for three months even, on the receipt of one dollar, in coin or stamps. It is our belief that no one will wish to discontinue the paper after being a constant reader of it for even that short period.

## Mining and Scientific Press.

The MINING AND SCIENTIFIC PRESS is published at the Exchange Building, Room 27, corner of Battery and Washington streets, San Francisco, Cal., at FIFTY CENTS per month, or \$4 per annum, in advance.

C. W. M. SMITH and W. B. EWER, Proprietors

#### Engravings, Electrotypes, etc.

We execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STENOGRAPHY and ELECTROTYPING, Designs of every description—Buildings, Sketches of Towns, Machinery, Stamp Files, Seals for Plans or Colored Printing. Job Work executed with dispatch at low rates.

PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

### To Printers.

AN INTEREST in one of the most flourishing and best paying Newspaper Offices in the mountains is offered for sale on easy terms. A rare opportunity is hereby presented to any printer desirous of establishing himself in a good business in one of the healthiest, most thriving and delightful mountain towns in the state. For further information enquire at this office.

#### MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

THIRD YEAR! VOLUME VI.—NEW SERIES!

A new volume of this extensively circulated paper commenced Sept. 11, 1862. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

#### The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

#### The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

#### The Mechanic and Manufacturer!

Will be greatly benefitted by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

#### To Chemists, Architects, Millwrights and Farmers!

This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

#### Terms.

To mail subscribers:—Four Dollars per annum.

#### Club Rates.

Five Copies for Six Months, \$8.  
Ten Copies for Six Months, \$16.  
Ten Copies for Twelve Months, \$30.  
Fifteen Copies for Twelve Months, \$44.  
Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 50. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

EWER & SMITH, Publishers,

Room 27, (formerly) U. S. Court Building, Corner of Washington and Battery streets, San Francisco.

#### Our Mint, its Rules, Charges and Operations.

For parting silver from gold when gold

is below 300-1000ths. fine ..... 3cts per oz.  
" from 300-1000ths. to 750-1000ths. fine. 7 cts " oz.  
" " 750-1000ths to 950-1000ths " 14 cts " "

#### DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce  $\frac{1}{2}$  per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300 3cts. per oz. gross weight

301 " 500, 7cls, " " "

#### DEPOSITS FOR FINE BARS

\$1 16-4-11ths cents. per standard ounce,  $\frac{1}{2}$  per ct. gross value of silver for making bars; also when gold is contained  $\frac{1}{2}$  per ct. on gross value of gold for coining. Refining charges as in purchases.

#### BARs SOLD FROM REFINERY.

\$1 21cts. per standard oz.  $\frac{1}{2}$  per ct. gross value to be added for making bars.

#### DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz.  $\frac{1}{2}$  per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

#### DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz.  $\frac{1}{2}$  per ct. gross value of deposit for making bars.

## PROGRESS OF THE MINING INTEREST.

The encouraging reports, noticed for a few weeks past still continue to come in. From every direction we hear that the miners are doing well. Progress and development appear to be the order of the day. The important results so generally obtained from those mines which have been properly opened on the Eastern Slope, is exerting a marked effect in urging on the development of many, which have hitherto remained quietly awaiting the results of other operations in their neighborhood. From Esmeralda, from the Coso region, from Humboldt, from Reese River, from Virginia and its surroundings, we hear but one report, and that of the most encouraging nature. The Reese River miners, satisfied from the developments at Humboldt, are already fully at work taking out rock to be in readiness for the mills which are now in progress of erection in that neighborhood, and according to present appearances will soon occupy a prominent position among the various mining localities on the Eastern Slope. There seems to be a growing confidence in these mines, as well there may be, if they yield any considerable quantity of ore like samples which have reached this city. The cities and towns in California are losing a large amount of population and considerable money in consequence of these late new and extensive discoveries, but we shall soon begin to get ample returns, especially in this city—for whatever wealth may be gathered up in those regions must flow into or through San Francisco before it can reach the regular channels of trade.

The rush over the mountains at the present time is without a parallel in any former period of the history of silver-land. The hotels are crowded with guests, the hills and gulches covered with prospectors and the streets of the principal towns with buyers of "feet."

The *Enterprise* of Virginia City estimates the present weekly transactions in the Mining Stocks at the various Stock Boards in that city at from \$600,000 to \$800,000 exclusive of outside transactions which are set down at \$75,000 to 100,000 weekly.

## ESMERALDA.

A correspondent at Aurora City, under date of April 30, writes as follows:

The "GEN HOOKER" Ledge situated on Silver Hill between the Utah and Antelope is turning out good pay rock. The shaft is down about 35 feet and the ledge averages three feet in thickness. The company are prosecuting the work vigorously and have taken out about 60 tons of rock which will be crushed immediately.

The "JUNIATA" Ledge situated on Martinez Hill is one of the oldest discoveries in the District. There are two shafts sunk on the ledge—one 60 feet in depth, the other 97 feet. The rock is similar to that of the Wide West, on Last Chance Hill. Eleven thousand dollars were crushed from this ledge during the winter of 1862, but the claim has been lying idle until the last month. It is now incorporated and will be vigorously worked during the summer. A specimen of the rock can be seen at the Pioneer Club Rooms, San Francisco.

The "MINA REAL" Ledge, situated East of the Pond and Aurora is being vigorously worked by the Company. The main shaft is now down to a depth of 40 feet and the Ledge is over three feet thick. The rock is similar to the Pond and Garabaldi. There are about 45 tons of rock taken out which proves very rich.

The "ALPINE" Ledge, situated on Middle Hill, is being worked, and the rock prospects rich in both gold and silver. The shaft is down to a depth of about 30 feet and the ledge is about 2½ feet thick.

The "GREAT BRITAIN" Lead is one of the oldest locations on Middle Hill. The new shaft is down to a depth of 50 feet. The ledge is over four feet wide and the rock is similar to the "Pacific" on the same Hill. The Company have 100 tons of rock taken out ready to be crushed.

The Esmeralda *Star* of May 2nd gives encouraging accounts of the progress of the work upon the Peck and Rowel Lode located on Silver Hill. They have a 4-foot vein in a shaft 25 feet deep, improving as they descend.

The PAUL TUNNEL, on the same hill, is now in 150 feet, and making good progress.

The RUTH WINDSOR TUNNEL, on the same hill, is in over 100 feet.

The MAMMOTH TUNNEL, on Middle Hill, is in over 275 feet. This is the largest tunnel in the district, being 8 feet wide and 7½ high, designed for a double track. This and the two previously noted have large and valuable claims for which they are running.

The *Star* also notices progress on the Bright Star and Aurora Borealis Lodes, each of which present encouraging indications.

The PRIDE OF ANTELOPE is yielding rock very much like the main Antelope. The Company hold 800 feet of ledge.

The NEW ESMERALDA Company are pushing their work day and night and are expecting to strike another large lode in a few days.

SOL LEWIS looks exceedingly well, and is being worked constantly. A new shaft is down and the rock looks very handsome.

MT. BRALEY is progressing finely; a tunnel is now in one hundred feet, and if the work is continued, day and night, they will reach the ledge by the first of June.

The LILY DALE have sunk a shaft upon their lode, and are taking out rock.

The PRIDE of the Wide West have sunk a shaft and struck a good looking ledge.

## WASHOE.

The reports from Virginia and the neighboring districts are losing none of their interest or importance. The confidence which operators there have in the value and permanency of the mines is sufficiently indicated by the heavy stock transactions above alluded to. The chief interest, at the present time in that region appears to be centered in and about Gold Hill, where most important developments are constantly being made.

The MONITOR DISTRICT.—Exciting reports have of late been coming in from the Monitor and Peavine Districts. The former is located on the East fork of Carson River. Gold appears to be the predominating mineral, although quite a number of ledges are being opened which indicate much value in silver. A great number of ledges have been located in this district, nearly all of which, so far as developments have been made, are exceedingly promising. The lodes are generally very heavy, and are in the hands of but a very few individuals. The Monitor men acknowledge that there are ledges in the Territory which assay better to the ton, but they hold that no entire district presents better indications. They have also a very important advantage in having an abundance of wood and water to say nothing of excellent coal indications.

Adjoining the Monitor is the ALPINE DISTRICT, which presents the same general characteristics with the Monitor.

The East Fork of the Carson, in the immediate vicinity of the mines has a rapid and very even fall, affording a large number of most excellent mill sites. These mines are in a direct magnetic direction from Virginia City and are supposed to be a continuation of the same series of ledges, which appear there. The ledges, which are large and well defined are usually found on high and narrow hills, affording most excellent facilities for drainage and working. There is much reason to believe that this will soon prove very valuable as a mining region.

## MINING IN CALIFORNIA.

The great rush over the mountains, caused by the recent extraordinary developments in Silverland, is being sensibly felt throughout the interior. Many of our mountain towns which have for many years been improving, with a steady increase of population, have come to a sudden stand still, and some are even on the retrograde. Of course such a state of things will be but temporary. Of the many thousand now on their way from the East, but comparatively few will tarry on the other side of the mountains. The great bulk of the immigration will find its way into California and serve to fill up the gaps now vacant by the absence of the silver hunters.

THE COPPER EXCITEMENT is also operating to a considerable extent in checking the movement Eastward, by opening up new fields for exploration at home. A large number of miners are now actively engaged in developing this new interest, with most flattering prospects of abundant success. The copper mines which were first opened are mostly in the hands of a few individuals, who are quietly prospecting their work without availing themselves of the benefits of the Corporation Act. It is well known that several of these

companies are already realizing large profits, while, if we are to judge of the recent advance in the price of "feet" in some of the incorporated companies, we shall soon be able to enroll several of these public institutions under the head of "Dividend Paying Mines."

GOLD MINING.—In the present excitement with regard to silver and copper, our gold mines have been almost entirely ignored, and it is only now and then that the eye falls upon a paragraph in an interior exchange, announcing a new gold strike or an extraordinary "clean up" of that once predominant mineral. Still the few paragraphs of that kind which do come under our notice are quite sufficient to assure us that the gold mines still continue to "give out" their accustomed yield. It is to be feared that capitalists in this city are not giving the mines within the State limits, that degree of attention which they merit.

COPPER SMELTING WORKS.—The Cali. Copper Co. will be ready to commence smelting in about two weeks. They advertise for ores, which they will purchase on delivery at their wharf at Antioch. Propositions for purchase will be entertained on ores of any grade above seven and a-half per cent.

It is said that some of the most distinguished engineers in France have approved a plan for a railway from Paris to Marseilles, by which the journey, which now consumes 18 hours, may be made in 1½ hours. The distance is 510 miles. The plan has been submitted to the Emperor for his approbation.

The hydraulic system, in which sliding is substituted for running on wheels, in which that proposed.

## REMARKS

The Mining Share Market for the week has maintained quite an average degree of activity, although the amount of money which has changed hands has been comparatively small. Transactions have been confined to low priced stocks mostly.

Burnside has been the chief excitement of the week. 1172 shares, nearly one half the entire amount of this stock, has changed hands at rates varying from \$37½ to \$75. The sales commenced at \$37 and advanced steadily to \$75, on 30 days. From this point they commenced receding and closed the week at \$45. The advance in this stock was occasioned by telegraphic advices that a rich vein of ore had been struck, four feet wide. The subsequent decline was owing to advices that the tunnel had been closed. The excitement culminated on Thursday, on which day it was held in Virginia City at \$100, with \$90 offered.

Ophir has found no sellers, though it has been enquired for at \$2500. A dividend of \$18 per foot was declared on Wednesday.

In Gould and Curry the transactions have been confined to one foot, which sold for \$3500 on 30 days. It was offered at \$3700.

Savage has improved about \$200, but with light transactions.

Lady Bryan was quite freely dealt in early in the week at \$13. An assessment of four dollars per share having been levied on Saturday the stock dropped suddenly to \$9½. The Company has determined upon a thorough opening of the mine.

Lucerne has been slightly dealt in at \$8 @ 10. An assessment of \$10 per foot has been levied by the Directors, payable June 4th.

The Chollar, Daney, Burning Moscow, Chas. Caney and Norton have slightly declined.

Sacramento, Iowa and Meredith have improved somewhat over last quotations.

Hale & Norcross has been in fair demand at an advance of about \$125.

Yellow Jacket has been in demand on Thursday at \$60 @ 67½, an advance of \$150. Advices have been received that the suit in which this mine has been involved with regard to title has been decided in its favor.

Overman has also quadrupled during the week in this Market as well as at Virginia City.

Esmeralda Stocks continue to attract a large share of attention, with but very little speculative aspect. We refer to our record of transactions and Stock Board Report.

Humboldt and Reese River continue to gain favor in this market, and much interest is felt in the flattering reports from those sections.

Sheba finds buyers at \$48½, and is firm at that price. DeSoto is in demand at \$96, a slight decline. Peru sells at \$25. Moss at \$50 and Cuba at \$12½. Reese River company at \$3½.

## WASHOE STOCK REMARKS.

For the week ending May 7, 1863.

The Stock transactions of the week have been unusually heavy, "so large" says the Enterprise of the 2nd inst., "that we hesitate to mention the supposed aggregate." Money has been abundant and freely offered. A number of very significant fluctuations have been noted, but the general tendency of prices has been upward. Some claims, indeed, have been doubled and even tripled. The chief interest still attaches to the neighborhood of Gold Hill.

Birdsall has been largely dealt in during the week at a heavy advance. \$50 was freely offered at first, without sellers. Subsequently offers advanced to \$55 and \$60, which were accepted. On Thursday last it stood at \$65 @ \$70.

Burnside has advanced during the week from \$35 to \$90. This stock is principally held in San Francisco. The cause of this sudden movement is fully detailed in our San Francisco stock Remarks.

El Dorado has been much dealt in. There are more buyers than sellers. It has advanced during the week from \$75 to 150.

Allen has gone up from \$65 to 95, at which latter price it is saleable. Sacramento has also met with slight advance, although we continue our last week's quotations.

Harrison, Virginia Incorporation, was in demand at \$35 @ 37 during the early part of the week and was dealt in to some extent at these figures, but subsequently declined to \$27. It is now, however, held firm at \$37, but without takers.

The Montour and El Dorado ledges have been made the subject of much prophetic speculation. The ledge, by many, is claimed as the genuine Comstock vein.

Ponce de Leon appears to be coming into favor. It has been saleable during the week at \$9 @ 12, going up to that figure from \$4. A considerable amount has changed hands at these figures.

Texas is saleable at \$10 @ 12. Utah has advanced about \$3. There has been enquiry for Cole at \$18 to 20, without sellers.

## GOLD HILL DISTRICT.

There is no apparent abatement of the excitement with regard to claims in Gold Hill District. The Market still continues both active and buoyant. The transactions in shares are heavy and significant, and the enquiry earnest.

Overman has struck fine ore and its stock has gone up from \$55 to \$225—more than quadrupled in a week!

Belcher has met with a still further advance of \$150, and is now quoted at \$750.

Bullion has been slightly fluctuating, several hundred feet having changed hands at \$65 to 80. We quote bids at \$80, holders \$90, on Thursday last.

Koh-i-noor is attracting much attention, with no stock in the market. We quote bids at \$250 @ 300.

Loon has been somewhat fluctuating. Its tendency the first of the week was upward, and a still larger advance was predicted within the week. These anticipations have not yet been realized and we quote it at a slight decline on last week.

Caledonia has advanced from \$25 to 35, with demand. Laboring has improved during the week from \$15 to 30—an advance of 100 per cent.

The Eureka, Golden Eagle, North America, Princess and Hawkeye, have been in request at slight advances over previous quotations.

Michigan is in demand at \$50 @ 60. This is an old location covering some of the best ground in Gold Hill.

## DEVIL'S GATE DISTRICT.

The Devil's Gate District is again looking up, and beginning to attract much attention. The Enterprise expresses the opinion that this much abused district will claim and receive its share of attention the coming Summer.

The Pride of the West takes the lead in interest just now, having gone up during the week from \$125 to 225.

The Wide West also advanced from \$10 to \$12 @ 15, and many other claims in the district are improving.

## Volcanic Smelting Furnace.

PERSONS DESIRING INFORMATION AS TO THE USE of a measurement properties of this Furnace, and its application to the smelting of ores, when a satisfactory result is desired, or all other means of reducing ores and smelting metals from the sulphurates, can obtain all the explanation and advice in regard to the same, and terms of sale of rights to use the same, on application to J. Stevenson or T. Ogg Shaw, or by letter to the address through the Post Office of San Francisco, or by mail to the office of Col. J. B. Stevenson, 214 Merchant Street, or at the office of T. Ogg Shaw, 214 Merchant Street, or at the office of T. Ogg Shaw, 214 Merchant Street, or at the office of T. Ogg Shaw, 214 Merchant Street.

Time required for reducing ores by this Furnace from three to eight hours, and the amount of fuel only tenth as much as is consumed by other processes.

The process of condensation is applied to this Furnace which will save all those portions of precious metals which usually escape in a volatile form.

Attention of all interested in the subject is requested to examine the important results obtained by this process.

Persons wishing will be allowed to erect a trial Furnace of capacity for smelting one ton of ore or more, on giving an obligation to pay the usual fee for the right to it, should they continue to make use of the invention longer period than two months.

16 MRS. E. J. HALL, M.D., Proprietress.

## New Style of Lady's Buckle.

BOHM, INVENTOR & PATENTEE

THE SUBSCRIBER HAVING OBTAINED LETTERS PATENT from Washington for an improvement in the construction of Ladies' Buckles, is now ready to furnish the same in every variety of style. This buckle possesses several very important improvements over any other in use.

The invention having been carefully examined at the Patent Office, has been adjudged to be a useful improvement, and Letters Patent have been granted for 17 years. Examine all other buckles in

Usefulness, Strength and Appearance.

The Public is respectfully invited to call and examine the Buckle at the Jewelry Establishment of

BRADYMAN & LEVY,  
621 Washington Street, San Francisco.  
JOSEPH BROTHERS,  
407 Montgomery Street, San Francisco.  
FLORENCE & CONRAD,  
118 I Street, Sacramento.  
Agents for the Patentee.

Every Buckle sold will be guaranteed as to its Strength and Durability.

W. BOHM, Patentee.

## LEANDER RANSOM, Civil Engineer AND SURVEYOR,

Having been connected with the public works of the State of Ohio for 20 years, and the public surveys of the State of California for 7 years.

ALSO

## STATE LOCATING AGENT.

And as such having the sale of

10,000 ACRES OF STATE SCHOOL LANDS.

At the low price of \$1.25 per Acre.

Terms—Twenty per cent in cash and the balance

in installments of several years.  
OFFICE: Second floor of Express Building, N.E. cor. of Montgomery and California streets. oct-3m

## SPECIAL NOTICES.

**Office of the Nevada Copper Mining Co.** March 24, 1863.—At a meeting of the Board of Trustees, held this day, an assessment of Forty Cents per share was levied upon the Capital Stock of the Company, payable twenty (20) cents per share within thirty days, and twenty (20) cents per share within sixty days from this date, to the Secretary. By order of the Trustees, J. ARMSTRONG, Secretary.

**Office of the Tennessee Gold and Silver Mining Company, No. 7, Montgomery Block.**—At a meeting of the Board of Trustees, held April 20, an Assessment of One Dollar and Fifty cts per share upon the capital stock of said Company was levied, payable on or before Saturday, the 23d day of May, 1863. J. H. BLOOD, Secretary. [ma21] San Francisco, April 27, 1863.

**Office of the San Francisco Gold and Silver Mining Company, No. 7, Montgomery Block.**—At a meeting of the Board of Trustees, held April 20, an Assessment of One Dollar (\$1) per share on the capital stock of this Company was levied, payable on or before Thursday, May 21, 1863. J. H. BLOOD, Secretary. [ma21] San Francisco, April 27, 1863.

**Office of the San Patch Gold and Silver Mining Company, No. 7, Montgomery Block.**—At a meeting of the Board of Trustees, held March 30, 1863, an Assessment of Fifty Cents, (50 cts.) per share on the capital stock of said Company was levied, payable on or before Thursday, April 30, 1863. J. H. BLOOD, Secretary.

**Schmeltzer Gold and Silver Mining Company.**—At a meeting of the Board of Trustees of this Company, held April 11, 1863, an assessment of 25 cents per share was levied, payable in United States coin, to the Secretary, at the office of the company, No. 500 Montgomery street, on or before FRIDAY, April 17, 1863. ap20-1m M. G. ELMORE, Secretary.

## To Mine Owners.

**PARTIES having a Good silver Mine** and wishing for Machinery to work it for an interest in the Mine Will do well to apply at this office. No organized company need apply.

## WHEELER'S

### Amalgamating and Separating Pans.

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of triturating, and in cleaning up. By the introduction of the Separating Pan to follow the triturating this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

\* \* \* These Pans can be seen in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves. nol6-tf ZENAS WHEELER.

W. B. EWER,  
EDITOR.

A JOURNAL OF MINING, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

I. W. R. & SMITH,  
PROPRIETORS.

VOL. VI.

SAN FRANCISCO, MONDAY EVENING, MAY 18, 1863.

NO. 29.

## SPECIAL NOTICE.

We wish it distinctly understood that all the interest which Julius Silversmith ever had in the MINING AND SCIENTIFIC PRESS, ceased in November of 1862. EWER & SMITH are now the publishers and proprietors.

## OUR MECHANICAL INDUSTRY.

All our large machine-shops and foundries are at this time most active, and driving their machinery to the utmost in filling their orders. There are contracts now in active progress of completion from nearly every section of the Pacific Slope, from below Mazatlan in Mexico to Oregon on the north, and throughout every central portion, even to the distant regions of Humboldt and Rease River.

### THE VULCAN IRON WORKS.

We recently paid a visit to the Vulcan Iron Works, on First St., which are now under the management of PAUL TORQUET. At these works we found a large quantity of machinery in all stages of construction, from the pattern shop to the finishing room. This establishment is prepared to answer orders of every description in the line of Steam Engines, Boilers, Foundry work generally and the necessary wood-work to accompany the same. Like all our other foundries and machine shops this, also, is crowded with business, and constantly enlarging the area of its shop room. Their works already cover a very large area, which is reckoned by acres.

This firm at the time of our visit were just putting the finishing touches upon one of the largest orders for mill machinery ever given out in the State. The total cost of the same was \$30,000, and the whole was finished in *forty days* from the signing of the contract. This machinery has been constructed for the Las Cruzecitas Mining Company, a recent organization, formed in this city, for the purpose of working a mine located about 125 miles from Guymas. This is one of the old Mexican mines, worked years ago by the Spaniards and long since abandoned for want of machinery or energy to follow it below the water level. The machinery which has been constructed for this company consists of an engine with an 18-inch cylinder, and  $3\frac{1}{2}$  feet stroke, capable of being worked at 90-horse power. This, we believe, is the largest stationary Engine ever constructed in California. The Main shaft is six inches in diameter where the power is taken from the engine. The mill consists of five batteries of five stamps each—25 in all. Each stamp weighs 612 lbs. The length of the engine-bed is 21 feet. The fly-wheel is 16 feet in diameter and weighs over 7000 lbs. Three boilers, 42 ft. long, with five five-inch flues each and a fire surface of 960 square feet, will be employed.

The process to be employed at this mill is that known as the "Freyberg Process." 24 amalgamating barrels will be used, capable of holding 200 lbs. of ore each. The entire weight of machinery, including the wood work, which was also made at this establishment was 90 tons. It went down by the Oregon on her last trip.

A large amount of other machinery work was also in pro-

gress of construction, as indeed, is the case all the time, at this establishment. The energy and skill of San Francisco machinists is limited only by the demand upon their efforts and genius. The day is not far distant when the machine shops of this city will be prepared to undertake anything within the range of mechanical possibilities. We propose to continue our notices of individual establishments from week to week, and shall endeavor in our progress through the various foundries and machine shops to collect a fund of statistical information, for embodiment in tabular form, which shall be valuable for reference.

We regret exceedingly that the former proprietor of the MINING AND SCIENTIFIC PRESS, could not have been allowed to rest in peace and quietness, "after life's fitful dream was over;" but some luckless wight, like "Banquo's ghost," will not down, and has set him up, with other notables, in caricature. And to further illustrate, has used the name of the MINING AND SCIENTIFIC PRESS, which paper *Silversmith* has had nothing to do with since November last.

At first we were inclined to be angry and kick the fellow who thus should seek to bring ridicule upon our labors; next we thought of the law, but soon learned of the utter irresponsibility of the parties, and upon mature thought, concluded to let the matter rest, hoping that the Artist, the Vendors, "Emperor Norton," "the Fat Boy," the "Handsome Boy" with the tooth brush, the "Rag Man" and all the others, will meet at last, where "grub" is free, with "Bummer and Lazarus" to lick the tears from their eyes.

The exports of treasure since the 1st instant, have been as follows:

May 2—Per Constitution .....	\$1,010,189 06
May 2—Per Eberhard, to Manila .....	15,000 00
May 5—Per Oregon, to Mexico .....	3,950 00

Total since 1st inst. ....	\$1,029,139 06
Previously this year .....	15,892,103 74

Total since January 1st, 1863. ....	\$16,921,242 80
Corresponding period of 1862. ....	12,293,139 35

Excess this year .....	\$4,628,103 25
------------------------	----------------

The coinage at the Branch Mint in this city for the month of April was—

Gold .....	\$1,710,000
Silver .....	69,000

Total .....

A communication from "J. P." at Copperopolis, came to hand too late for insertion this week. It will appear in our next issue. The writer is a practical copper miner, and his letters will be read with interest and profit. Practical suggestions and hints are what we want, at this time, especially upon matters pertaining to the growing interest of copper mining. We are also indebted to the same party for the loan of a volume of "Lamborn on Copper," from which we shall, from time to time, extract whatever it may contain of value to the copper miner and prospector.

**CORRESPONDENCE.**—In order to make room for the valuable and interesting correspondence which has come to hand the past week, we have been obliged to omit our usual mining summary. Its loss, however, is more than made good by the varied and valuable mining information contained in our Humboldt and Amador County letters.

We would call especial attention to the letter of "MINER," which contains several suggestions worthy of thought, by all practical miners. Correspondents will also do well to consider that portion of it which relates to them. The necessity of a common medium of communication, and the value of an interchange of ideas and the results of experimental mining operations, is especially worthy of consideration. The columns of this paper are open to all such communications. We trust "MINER" who has proved himself so apt at suggestions, will not forget to put them in practice also. We infer that he is not altogether without an experience, which would be valuable to his fellow miners. Let us have that to begin with. It may serve to call forth other criticism, or some other experience, which will be of value to the mining public generally.

Our Amador correspondent gives a very interesting description of the Oriental Copper mine, describing its varied and changing appearances as the workmen descended upon its dip. The characteristics of this vein are worthy of study by operators in other localities. Similar descriptions of other characteristic veins, would be read with interest and profit. Copper veins present a much wider and more intricate field of study than gold, and we should be pleased to hear from correspondents in such localities.

Our Humboldt correspondent, "QUARTZ," gives us quite a detail of mining progress in the Buena Vista District, and promises to furnish our readers similar information with regard to other districts in that interesting region. "QUARTZ" is a man who never promises what he does not intend to perform. His letters will be found always reliable.

**AN ITEM FOR GRAY-HEADS.**—An English writer has recently asserted that an undue proportion of lime in the system is the cause of premature gray hair and advises to avoid hard water, either for drinking pure or when converted into tea, or coffee, or soup, because hard water is always impregnated with lime. Hard water may be softened by boiling it; let it become cold then use it as a beverage. It is also stated that a liquid that will color the human hair black, and not stain the skin, may be made by taking one part of bay rum, three parts of olive oil, and one part of good brandy, by measure. The hair must be washed with the mixture every morning, and in a short time the use of it will make the hair beautifully black, without injuring it.

A London paper says, at present 110 mails pass through the pneumatic dispatch tube from the station to the district Post Office during the day, and not only letters, but but trucks of iron of the weight of five tons have passed through, and adventurous visitors now and then perform the journey to their delight.

## MINING CORRESPONDENCE.

## COPPER MINING IN AMADOR COUNTY.

We give below the concluding portion of a private letter from an old friend and neighbor, then, like ourselves, not overburdened with this world's goods, but now owning large interests, in several of the most valuable copper mines in the State. The writer, the Rev. I. B. Fish, it will be remembered by some of our readers, was the fortunate discoverer of what is now known as the Oriental Copper Mine. Mr. F. in company with two friends, was passing along the road on horseback, when observing some peculiar quartz croppings, he dismounted and to his astonishment, found that the "croppings" before him consisted of copper ore of most astonishing richness. Of course the travelers lost no time in staking off the ground and taking the necessary steps to secure their discovery. The fact that such immense mineral wealth should have remained undisturbed and unnoticed for so many years, on the direct line of a greatly traveled thoroughfare, affords another evidence of the importance of an extended mineralogical education among the people of California. The importance and value of this discovery is quite closely foreshadowed in the interesting letter which we subjoin. We shall be pleased to hear from our correspondent often, and to receive the promised call whenever he may visit this city:—

JACKSON, CAL., MAY 9, '63.

Very unexpectedly, I am involved quite deeply in mining operations. I was one of the discoverers of the *Oriental* Copper lead, in the Forest Home Mining District of Amador County, and am a stock holder in the Oriental Co., and in several other good leads in this county. And all quite unexpectedly. Messrs. McKim, Trowbridge and myself discovered the *Oriental Lead* on the 10th of Feb. last. Heavy and beautiful Gosson croppings were seen bulging out high and boldly, in a straight line between well defined, gray granular trap walls, lively with mineral sulphurets, for a distance of one hundred feet. At three different points, between the Gosson croppings, we found boulders of rich and beautiful copper ore, which had doubtless been formed by the working of gasses from below. [Our readers will find the probable solution of this phenomenon under the head of our Miner's Laboratory, next week—Ed. Press.] On the 17th of Feb. we incorporated the company, estimating the value of the mine of 1400 feet at \$100 per foot. We now have a shaft down on the lode, thirty feet deep, in which, through the first twenty-five feet, we found almost every variety of ore except the solid oxides and sulphurets. At the first we found most beautiful *malachite*, then the red green, and blue rock ore, or "horn blend," which assayed at *Molitors* in San Francisco, 42½ per cent copper, and also beautiful masses of solid green sulphate of copper. But at the depth of twenty-five feet these variations gave way to white, solid, live mundic, a vein of grey copper ore, and a black vein with silver lustre. Of this latter we had a piece assayed at *Molitor's*, which to our surprise yielded traces of gold, \$62 37 of silver to the ton, and 15¼ per cent. of copper. Now at the depth of 30 feet we have a vein of 6 feet in width, of solid grey, yellow and black oxides, and sulphurets of copper, with a vein of grey silver ore with apparently little traces of copper next the east or head wall. In all a vein of saleable ore, eight feet in width, and widening. This is a most remarkable mine and now its real value is more than that put upon it in the incorporation. The office of this company is in Jackson. Wm. L. McKim is Sec.

The Cosumnes company, also incorporated, hold 100 claims of 200 feet each, of two leads, running west of and parallel with the *Oriental*. They also have an immensely rich mine. Have already out several tons of first rate ore, of almost every known variety, and are now making shipments. There are also several other companies in that district, opening onto splendid ore—one of which is the *Exchange* company, on the Ledger lode. A dozen or more companies have splendid prospects.

Of the Newton Co. near Ione Valley, I may write you soon. This mine is opened to the depth of nearly 200 feet, and is proven rich beyond calculation, and apparently inexhaustible. In it copper was first struck at the depth of about 75 feet. I cannot now, but if you please I will as

soon as I can gather together the facts, give you a more particular account of the number and value of copper claims, and mines in Amador Co. I. B. Fish.

## COMMUNICATION FROM A PRACTICAL MINER.

A practical and intelligent quartz miner operating near Virginia City, writes as follows:—

EDITOR MINING AND SCIENTIFIC PRESS:—I notice a large amount of "Mining Correspondence," published in the various journals of your city and in papers, generally, throughout the state, but it is seldom that these communications contain anything beyond mere common place remarks about the general appearance of the country, an enumeration of a few companies or claims, in which, it is presumable, the writers are more or less personally interested, and perhaps the announcement of a new discovery in the neighborhood where the letter is dated. The information usually contained in these letters is of little or no practical value. There are two classes of information which are especially valuable to miners and persons, interested in mining operations.

First, the miner is anxious to gain some practical information with regard to the various processes of working ores, and to learn the indications by which these ores and minerals may be discovered and made known to the prospector.

If miners would communicate through the Press, their experience in working the various kinds of ores, and thus compare notes with each other, the result would be the diffusion of a vast amount of information which would be of much practical value. Now why is not this done? Whenever three or four mill men or mining Superintendents meet, the subject of their mutual, individual experience, is almost sure to form an important topic of conversation. What man is there, who does not admit that he gains a large amount of information in visiting different and distant mining localities and comparing notes with others engaged in the same class of operations? Why not then make this a subject of intercommunication through the press? There is scarce a quartz miner in the state, who has been engaged for any length of time in the business who has not tried a great many experiments, and operated with different kinds of machinery—differently arranged batteries, various kinds of amalgamators, pans, etc., etc. Now this experience made public, cannot fail to be of benefit to somebody. If it does nothing more it will serve to get up an increased interest in the business, and stimulate a spirit of enquiry and invention which cannot fail to be of great general benefit.

You, Mr. Editor, have frequently alluded to different kinds of machinery and processes, which have been devised, and have sometimes expressed your opinion of them. But that is not altogether what we miners want. We want to know what those persons who are using that machinery think of it. We want the practical information, which can only be derived from the mill or the mine—that's what we want. [Our correspondent is sensible and hits the nail squarely on the head, every time.—Ed. Press.]

I see by the last number of your paper which I have received, that you propose to give us some information, about prospecting, a knowledge of minerals, etc., and that you have commenced a series of articles under what you call "the Miners' Laboratory," which you propose to continue. That is a kind of information which I think you can pick up for us among your books and libraries, which may be valuable to us working miners and especially to prospectors. I shall read your articles very carefully, and, I trust, derive much information from them. But when it comes to talking about "processes," mining, machinery, etc., I think, with all due allowance for your editorial judgment, that a little practical information, from persons who are actually employing these processes and using the machinery described, will be of more real service to us miners, than that class of information derived from any other source. [Our correspondent is right again.]

Another thing, Mr. Editor, we miners are generally pretty hard working men and can't afford either the money, or the time to take and read all the papers in California, to see what all the miners have to say about this business and experience. If we read our local paper and one other, say a commercial paper, from your city or state, and then take the MINING PRESS, it is about all we can manage. We want our local paper for its local news; we want a commercial

paper for general intelligence, and we want the MINING PAPER, as an indispensable necessity to keep us posted and fully up to the times in all matters of mining interest. Now the habit which mining correspondents have of sending their communications promiscuously to all the papers in the state, it appears to me, is "a very bad habit," and a very inconvenient one to those of us who desire to keep posted in such subjects; because, to do so, we must open a reading room, and file all the principal papers in the state, and sift out an immense amount of chaff to get a little wheat. Now as we have a mining paper, why cannot miners use it as a common medium of communication with each other? [Our correspondent puts a very sensible query.] But my letter is getting, I fear, quite too lengthy for your columns. I have a number of other suggestions which I would like to make, but for fear of wearying your readers, I will defer them till another time. Yours, truly,

We hope to hear from "MINER" often. [Ed.]

## HUMBOLDT CORRESPONDENCE.

UNIONVILLE, N. T. MAY 1, 1863.

EDITOR MINING AND SCIENTIFIC PRESS.—When I left San Francisco I promised to give you and the readers of your valuable paper an occasional letter from this section, and so far as I am able I will make my promise good. It has been so short a time since my return that you must be content with a very short and impartial account of the mining operations that are going on in this region. I find, upon my return, our mountains and valleys dressed in the beautiful robes of spring, our little village presenting a cheering aspect, and our miners, with cheerful and smiling countenances, with their sleeves rolled up and pitching into their ledges.

## PROGRESS OF THE MINING OPERATIONS.

The Peru Company, on the Peru ledge, are running a tunnel to open their claims. The tunnel is now in 45 feet. The Nevada company, on the same ledge, have their tunnel in upward of 100 feet and the work still progressing. The Mars company are sinking a shaft on the end of their tunnel. The shaft is now down over 60 feet, and they are taking out some very rich rock.

The Logan company, on the Manitowac, are sinking a shaft on their claims with fine prospects. The shaft is now run thirty feet deep. The Dubugne company on the same ledge are taking out some very rich rock for shipment to San Francisco. The Sargent company are putting their tunnel through as fast as possible. They are within fifteen feet of the ledge. The Cincinnati tunnel is in seventy-five feet. The Rising Sun tunnel is in one hundred and seventy-five feet. The Maine ledge has a shaft thirty-five feet deep. The ledge is four feet wide and nearly all of it very rich mineral. The Alba Nueva tunnel is in two hundred and seventeen feet, with a shaft sixty feet deep at the end of the tunnel. The National has a shaft eighty feet deep on their ledge. This company have about forty tons of ore at the mill and about the same amount at their shaft. The Governor Downey has a shaft on their claims forty-eight feet. The Mary Bell tunnel is now in two hundred and eighty feet.

The Eagle tunnel is in over sixty feet. The shaft on the Lewis Cass is now down over sixty feet on the ledge. The Adams tunnel on the first north extension of the Mars ledge is in over one hundred feet. The Shasta company running for the Alba Nueva and the Governor Downey ledge have their tunnel in two hundred feet. The Delerio, Flora Temple, Brutus, Independence, California, Jackson, St. Louis, and Kingston ledges are all being opened either by tunnel or shaft.

The Bloomfield company on the Marblehead ledge have recently struck some very rich ore. The Hamlin company are going to commence their shaft in a few days. This ledge is over four feet wide and immensely rich. It is a recent discovery and the fortunate owners feel confident of realizing an immense fortune from their claims, and "Quartz" thinks that they will not be disappointed. A very rich ledge called the "Unknown" has recently been discovered by R. G. Ferguson who is a very worthy and industrious old gentleman. The Schuykill company are now sinking a shaft on their claims. This ledge is between five and six feet wide and some of the rock is immensely rich. I have seen speci-

mens of this rock that were over one third pure silver. [See have we—Ed. Press.]

#### STAGES—THE FIRST NEWSPAPERS.

Langton & Co. are now stocking the road between this place and Carson and Virginia Cities for a tri-weekly line of stages. They have been running a weekly stage only, during the winter, but travel is increasing so rapidly on this road, that we shall soon require a daily line, and Sam. Langton and Capt. Ayer are just the men to keep up with the wants of the country in the Stage and Express line. Our town can now boast of a printing office. The first number of the paper to be called the "Humboldt Register" will be issued tomorrow. Humboldt will now be able to speak for herself through the press.

#### PROSPECTING, ETC.

Considerable prospecting is now going on in the various mining districts, especially in Alabama and Table Mountain districts. These districts are situated on the range of mountains east of the Humboldt range. There is plenty of timber there which will be of great advantage in working the claims. The Silver Cord is the name of a very rich ledge located in Table Mountain district. The ledge is over five feet wide and assays over five hundred dollars per ton from top rock. The Sulo ledge in Alabama district is another rich ledge and assays very rich, but we are unable to give the figures. The Batavia, Oro-fino, Telagrae, Missouri and Humbag are all very rich and well defined ledges. The owners of the last named ledge are so thoroughly convinced that the ledge is immensely rich that they have no fears of its losing its reputation on account of its name.

#### MILLS WANTED.

We need many more mills here and I wish some of the intelligent capitalists of your city could be induced to pay our country a visit and see for themselves.

As I informed you in the beginning, this letter must necessarily contain only a partial account of mining operations here. I have confined myself principally to Buena Vista district, for the reason that I have been unable to hear from the other districts since my return. In my next I will endeavor to give you an account of them. All of the districts are rich and your readers shall be informed of them occasionally by

QUARTZ.

#### TO MINERS AND PROSPECTORS.

In view of the frequent accidental discoveries of valuable mineral deposits, other than gold, in almost every section of the State, which have of late been made, it is but reasonable to suppose that prospecting even in California, has but just commenced. The simplest and most universal of all metalliferous deposits is gold. It rarely occurs in any other form than that of "free gold" which is readily discernable to the naked eye. An examination of any rock or earth for gold is an extremely simple process. If its presence is suspected in alluvium, the simple washing of that alluvium in a pan is an invariable test. If in rock of any description; that rock pounded fine in a mortar and washed, in the same manner as alluvium, will usually expose its gold to the naked eye, if there is any there in paying quantity. The only exceptions, are where the gold is contained in iron pyrites, or copper pyrites containing also iron. In either of the two latter cases the presence of gold may be readily ascertained by placing the pyrites in any suitable vessel and keeping the contents at a moderate heat for from four to six hours, with frequent stirrings, by which means the sulphur will be evaporated, and the copper, if any is present, changed to a dull red color, and the gold retaining its natural appearance, on subjecting the whole to the usual panning process, may be readily seen by the naked eye.

Not so with other metals. Silver, copper, zinc, nickel, and many others appear in such a great variety of metalliferous forms as generally to defy all but the most practical and scientific eye. No description of these ores can be written which will afford any very important aid to the inexperienced in making explorations. After reading descriptions, however, and carefully examining the specimens described, the explorer may go out and search with some degree of confidence and intelligence. A study of the characteristics of the sulphuret ores alone, would lead an explorer to pass over, entirely unnoticed, the richest varieties

of the ores known as Chlorides or Horn Silver, which, from the facility with which they may be worked, and their usual richness, are generally considered the most valuable of silver ores. There is much reason to believe that this variety of silver ore will be extensively found in all the volcanic regions of this State. So with many other ores.

Considering the great difficulty, in the present lack of cabinet collections, and other means of instruction, to acquire a practical mineralogical and geological education in this State, and desirous to aid, to our fullest capacity, the development of our mineral resources, we hereby make the offer to miners, prospectors and all others, who in their travels or explorations may come across specimens having the appearance of rarity or value, to carefully examine and pronounce upon the same, free of charge, as to their characteristics, value, etc., whenever any such specimens are brought or sent to this office free of cost to us. We have already been called upon in many such cases, and we shall at all times be willing to give our attention to any such requests which may be presented to us.

Our object is to furnish the miners of California with every class of information which shall be valuable to them in the progress of their calling and in the development of the mineral resources of the State, and we know of no way in which we can devote a portion of our time more to the interests of miners than in the manner here proposed. The only equivalent we ask is that they shall do what they reasonably can to sustain and improve the paper devoted exclusively to their interests.

In carrying out the plan we propose, every miner and prospector should be at all times on the lookout for any new mineral. The ordinary rocks with which the miner meets in his travels and labor, and which possess no mineral value are usually well known. Whenever a rock presents any unusual appearance in conformation, color or other characteristic, attention should at once be given to it. There is scarcely a piece of quartz or rock of a quartzose nature, which presents any uncommon appearance in texture or color that has not been thus modified by the deposit or intrusion of some mineral substance. If such rock is found upon or near a vein of quartz it should be carefully examined "in place," and if the cause of its peculiarity is not evident and readily seen, it should not be passed carelessly by. There may be value in it, although the gold may not shine there. We shall commence in our next issue a series of articles describing as accurately and as intelligibly as possible all the ordinary mineral substances which may be likely to come under the notice of the California prospector. These articles will be published under the head of "THE MINER'S LABORATORY," and will be found of great value to the mining public. [Mining and Scientific Press, April 20.]

SUBSCRIBE.—Are you a miner and not a subscriber to the MINING AND SCIENTIFIC PRESS? If so, you are an annual loser of many times the price of a year's subscription, particularly if you are engaged in quartz mining. The same amount of practical information, important to miners and mechanics, which is contained in a volume of the Press, cannot be bought from the shelves of any bookstore in the country for the price of several year's subscription. Do you ever send a paper to the "Old Folks at Home?" If so, and you desire to send important information and valuable reading matter, you can find no paper that will be read with so much eagerness by them, or one that will convey to them so full an account of the real industry of the country as the MINING AND SCIENTIFIC PRESS. We invite all to send us their names and four dollars, or two dollars for six months, and become patrons of the only mining paper printed on the Pacific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examination, and with the hope that it may so far meet with their approval as to warrant their subscribing for it at once. It is not our usual custom to receive a subscriber for less than six months; but inasmuch as we are anxious to introduce the paper where it is not now known, we will, for the present, send the Press for three months even, on the receipt of one dollar, in coin or stamps. It is our belief that no one will wish to discontinue the paper after being a constant reader of it for even that short period.

## Mining and Scientific Press.

The MINING AND SCIENTIFIC PRESS is published at the Exchange Building, Room 27, corner of Battery and Washington streets San Francisco, Cal., at FIFTY CENTS per month, or \$4 per annum, in advance.

C. W. M. SMITH and W. B. EWER, - - - - Proprietors

#### Engravings, Electrotypes, etc.

We execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEREOTYPING and ELECTROTYPING, Designs of every description—Buildings, Sketches of Towns, Machinery, Stamp Mills, Seals for Plain or Colored Printing. Job Work executed with dispatch at low rates. PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

## To Printers.

AN INTEREST in one of the most flourishing and best paying Newspaper Offices in the mountains is offered for sale on easy terms. A rare opportunity is hereby presented to any printer desirous of establishing himself in a good business in one of the healthiest, most thriving and delightful mountain towns in the state. For further information enquire at this office.

#### MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

THIRD YEAR! VOLUME VI.—NEW SERIES!

A new volume of this extensively circulated paper commenced Sept. 11, 1862. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

#### The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

#### The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

#### The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

#### To Chemists, Architects, Millwrights and Farmers!

This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

#### Terms.

To mail subscribers:—Four Dollars per annum.

#### Club Rates.

Five Copies for Six Months, \$8.  
Ten Copies for Six Months, \$16.  
Ten Copies for Twelve Months, \$30.  
Fifteen Copies for Twelve Months, \$44.  
Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 80. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

#### EWER & SMITH, Publishers,

Room 27, (formerly) U. S. Court Building, Corner of Washington and Battery streets, San Francisco.

#### Our Mint, its Rules, Charges and Operations.

##### For parting silver from gold when gold

is below 300—1000ths. fine . . . . . 3cts per oz.  
" from 30—100ths. to 750—1000ths fine. 7 cts " " oz.  
" " 750—1000ths to 950—100ths " 14 cts " "

##### DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce  $\frac{1}{2}$  per ct. on gross value of all gold continued for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300 3cts. per oz. gross weight

301 " 500, 7cts, " " "

##### DEPOSITS FOR FINE BARS

\$1 16-4-11ths cents. per standard ounce,  $\frac{1}{2}$  per ct. gross value of silver for making bars; also when gold is contained  $\frac{1}{2}$  per ct. on gross value of gold for coining. Refining charges as in purchases.

##### BARs SOLD FROM REFINERY.

\$1 21cts. per standard oz.  $\frac{1}{2}$  per ct. gross value to be added for making bars.

##### DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz.  $\frac{1}{2}$  per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

##### DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz.  $\frac{1}{2}$  per ct. gross value of deposit for making bars.

## THE MINERS' LABORATORY.—NO. III.

We closed our chapter under this head for last week somewhat abruptly while discoursing upon the "Peculiarities of Quartz Veins." We have stated that these veins are usually found in "setts" or clusters. California is no exception to this rule. The general direction of the older class of quartz veins in the auriferous districts on the western slope of the Sierra Nevada is north and south; the east and west series of veins is more recent and may be called secondary. Mr. Remond of this city, who has paid much attention to the geology of the quartz veins of this state, remarks that "the metalliferous character of the secondary quartz veins is worthy of note. They bear gold, often in a crystallized form, which is very rarely the case in lodes running north and south. The numerous threads or minute veins crossing them contain much galena, in small leaf-shaped masses, and sometimes in cubic crystals, with more or less silver. These lodes also contain much white iron pyrites, with some arsenical and copper pyrites." The following paragraph, which like the one above quoted, was written some two and a half years since, for *L'Echo du Pacifique*, and prophetic at the time, has since been fully verified by actual discoveries.

"The combinations of these different metals suggests the possibility of the discovery of silver mines. Some specimens taken from the quartz mines of Soulsbyville, resemble the argentiferous ores of Washoe. At Washoe the silver is mixed with lead, iron, arsenic, copper and a little antimony, all the metals being in a condition of sulphurets. At Soulsbyville, the iron and lead predominate, and the other metals are in smaller quantities, with a total lack of antimony."

No other portion of the world has been so carefully studied with reference to its metalliferous formations as Cornwall and Wales, and it has been asserted with much confidence, that a description of these veins would, generally speaking, suffice for those of every other portion of the globe. So far as their direction, length, depth, and dip are concerned, the assumption is doubtless quite correct, but with regard to their contents, we apprehend quite distinctive characteristics will be noticed. No one who has acquainted himself with the quartz veins on the two slopes of the Sierra, can have failed to notice most marked and distinct characteristics between the two. Other peculiarities may be noticed between those and the veins which are found far out toward the interior of the "Great Basin," and others still more marked when we reach the opposite rim of the Great Basin in the neighborhood of Pike's Peak, as will be seen from the following extract which we gave in our issue of April 20th, from a correspondent of the *Territorial Enterprise*.

"The Pike's Peak ores contain no quartz. They are iron pyrites, more or less mixed with copper pyrites, lead, antimony, etc. \* \* \* On sinking upon this no veinstone whatever is found. The vein is a simple crevice in the granite bed rock filled with pyrites."

In fact almost every vein has much that is peculiar to itself. Perhaps the most simple of metalliferous veins are those known as "gold-bearing," and it is to those, almost exclusively, until within a short period, that the miners of California have chiefly paid attention. Until after the wonderful developments of the Comstock lead in Washoe, not one prospector in fifty in California ever thought of examining a vein for any other mineral than gold, which is almost always found pure and free, and consequently readily known to the most unpracticed explorer. Hundreds of veins, in California, now known to be of the highest value in silver and copper, were, in the early days of our mining experience, passed by as worthless, simply because they did not "show gold" in working quantities.

Very few of our readers are ignorant of the ordinary indications by which the probable presence of quartz veins is noticed, or the manner usually employed in discovering their locality, or tracing their direction whenever found; hence we will not weary their patience by giving details so generally known.

In examining into the phenomena of quartz veins on the Pacific Slope, it should be borne in mind that but a very limited time has elapsed since the first efforts of mining were undertaken here. On the eastern continent and especially in Cornwall and Wales, mines have been wrought from time immemorial, and yet scarcely a year passes without

adding some new fact to the great mass of information already stored up by the generations who have lived and died in studying the theory of these mines, the details of their structure, the relation of those veins to the various ores which they contain, and to the enclosing rocks, etc., etc.

Many of our citizens complain of the apparent dilatoriness of our State Geological Survey, from the fact that our miners are not already put in possession of facts for which English miners have patiently waited whole decades, and for which the English Government has paid an hundred fold more, than our Commission has yet asked for. Such persons cannot be aware of the difficulties and labors attendant upon the solution of the various problems presented in the investigation of so complex a subject as the study of such a wide and varied mining field as is found near and within the boundaries of the State of California.

## THE GEOLOGY OF COPPER.

The recent discovery of numerous and valuable veins of copper, throughout, pretty much the entire length of the state, and the consequent especial degree of attention which is now being drawn to this new interest, has induced us to vary, to a certain extent, what would otherwise have been a natural procession of subjects, in such a series of chapters as we have commenced. And in accordance with numerous requests to that end, we shall "interpolate" whatever number of chapters, may be required to place before our readers all attainable information on the subject of copper, which can be of any practical value to prospectors after, or workers in that mineral. In doing this we shall have occasion to repeat, to a certain extent, the material points of some paragraphs which have already appeared in previous numbers of the *PRESS*.

In referring to the geological conditions under which copper is found, we shall commence with Cornwall, a district which furnishes nearly one half of all the tin and copper produced on the globe. The rock in which the copper bearing ores of this region are found is principally clay slate, or *killas*, as it is there termed. The country, however is much broken up and diversified by obtrusive granites and elvans, which have been protruded through slates by igneous agencies from below. The general direction of the copper veins is east and west, and nearly at right angles with the tin lodes. The ores of copper and tin are seldom found in the same vein in Cornwall, and neither metal is often found in very great abundance at a less depth than 80 or 100 feet below the surface. Some copper veins in this district have been traced several miles—in one instance seven, without any evidence of discontinuance even at that point. No person has ever yet seen the bottom of a vein of either tin or copper. The ores found there are usually the yellow sulphuret of copper and iron, with which are associated at times, black, and gray sulphuret, red oxide, and native copper. The general average of these veins is about 2½ per cent., but which by dressing is actually brought to about eight per cent. before smelting.

**A NOVEL LETTER CARRIER.**—A curious project has been set on foot for the speedy conveyance of letters between England and France. It is proposed to erect in both countries, at a distance of about 10,000 metres from the coasts of Calais and Dover, a strong edifice of masonry, containing a steam engine of sufficient power, by means of which an immense wheel, 25 metres in diameter, is made to turn forty times a minute.

By this rotation a series of wires, forming a gigantic strap extending across the channel, is coiled around the wheel at, one end, say at Dover, and uncoiled at the other, Calais, and conversely. To this strap india-rubber leather bags are to be attached, which are thus conveyed across the channel at 3,000 metres per minute, so that, within the space of twelve minutes the letters and despatches from one country may be landed in the other.

**A Contrast.**—How rich the following paragraph appears, which was originally printed in the *English Quarterly Review*, in March 1825:

"We are not advocates of visionary projects that interfere with useful establishment. We scout the idea of a railroad as impracticable. What can be more palpably absurd and ridiculous than the prospects held out of locomotives traveling twice as fast as stage coaches. We should as soon expect the people of Woolwich to suffer themselves to be fired off upon one of Congreve's ricochet rockets, as to put themselves to the mercy of such a machine, going at such a rate.

## THE MINING STOCK MARKET.

The Stock Market both in San Francisco and Virginia has been unusually depressed during the past week, with restricted operations, even in approved shares. Several causes have led to this depression, neither of which proceed, at all, from any lack of confidence in the mines themselves. Speculative operations have not been noticed, in part, for the reason that no new developments have occurred, on which operations in this line could be based. The unusual excitement with regard to eastern intelligence absorbed much attention that would otherwise have been expended in "feet" speculations; but probably the chief cause of the depression of the week may be attributed to the unusual stringency of the money market, which has operated, in some instances, so as to seriously interfere with time operators in meeting their engagements. The demand for money for stock operations has been exceedingly urgent, as high as 4 and 5 per cent having been offered on securities of substantial market value.

The present check upon operations in the mining market, is an encouraging indication, rather than otherwise, since it cannot fail to exert a healthy influence upon the legitimate business of mining, by reason of the effect it will have to discourage speculative actions, and so to some extent, encourage a more rational investment of capital, where it will increase material values. The flow of capital into the interior as material aid for the development of the mines, is daily increasing, and to its tendency in that direction, may be attributed, in no small degree, its lack for speculative operations upon Montgomery Street. The signs of the times indicate a growing conviction, that the business of swapping jackets is pretty much "played out," and that the folly of speculation is fast passing away and giving place to the more legitimate idea of a permanent development of the mines. The conclusion is now pretty much universal that the mines are not only rich but permanent, and that a sufficiency of the precious metals may be obtained therefrom by ordinary expenditure and industry, to satisfy any reasonable desires of gain; and that the most rational way of acquiring a fortune is to be content with ordinary risks and reasonable time, rather than to take the chances of precarious speculation, with the hope of winning a competency in a day or week.

We hear very favorable accounts from the mines of this region. A large amount of machinery will soon be put in operation there. A party of capitalists in this city who have recently sent agents into that region have become so well convinced of its mineral value that they are about to commence operations on a liberal scale, and have already sent down a party of working men, with machinery, etc., from which we confidently predict early and satisfactory results. That much gold exists in that section may be surmised from the following transaction which occurred there in the winter of '60 and '61.

A large amount of snow had fallen and a most severe winter was evidently upon them, with a pretty fair prospect of a cessation of mining operations until spring. But with the knowledge that the gold was there, it was resolved that Yankee ingenuity and energy could gather it up in spite of wind or weather. The miners went to work and constructed large sheet-iron tanks, filled them with snow then melted it and with the small quantity of water thus produced, added to the small natural flows, in some instances washed out as high as \$16 per day! Thus the element which is generally considered as a pretty effectual extinguisher of placer mining operations was made to furnish in greater abundance the very facilities needed for gold working! The gold of this region is of a very superior fineness—assaying as high as \$19 per ounce. We trust the expectations of even the most sanguine, with regard to this region may be fully realized.

**INCOMBUSTIBLE DRESSES.**—In the London Polytechnic Institution, Professor Pepper has lately exhibited in a most original and practical manner the relative combustibility of muslin dresses prepared with certain chemicals and dresses not so prepared. He brought forward a lay-figure, attired like a lady largely be-crippled. A light applied to the skirt of the dress soon caused the figure to be lost in a pyramid of flame, and some of the more susceptible of the spectators shrieked aloud at the frightful representation of a too frequent reality. For the second effect a real lady, attired in garments rendered incombustible by prepared starch, walked up and down between two troughs in which naphtha, furiously flaming played upon her skirt unscathed. The starch with which the incombustible dress was prepared contained about ten per cent of tungstate of soda and the phosphate of ammonia.

Mining of a substantial character is being prosecuted with vigor and there is now more work being done upon the various lodes in this District than at any period since the discovery of the mines.

**CHOLLAR MINING STOCK,**  
**CALIFORNIA STEAM NAVIGATION CO'S STOCK,**  
**BOUGHT & SOLD.**

## WHEELER'S

## Amalgamating and Separating Pans.

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of triturating, and in cleaning up. By the introduction of the Separating Pan to follow the triturating this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

\* These Pans have been in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves.

ZENAS WHEELER.

## A. C. MORSE,

Mining and Real Estate Agent,

OFFICE—S. W. corner Pine and Silver sts., Aurora.

**HAVING MADE ARRANGEMENTS** with MINER S. MARTIN ESQ., one of the principal Stock Brokers of San Francisco, I am prepared to BUY and SELL every description of Mining Stocks in Esmeralda District

## Pacific Mail Steamship Company.

## NOTICE.

**ARRANGEMENTS HAVE BEEN MADE** by which shipments of

## Gold, Silver and Copper Ores

can be forwarded under through Bills of Lading from San Francisco to England, at reasonable rates. For further particulars apply to

A. B. FORBES, Agent,

28-4f Corner Sacramento and Leidesdorff streets.

## P. M. STEAMSHIP COMPANY.

## NOTICE.

**Until further notice, the Steamers of** Pacific Mail Steamship Company will hereafter be dispatched on the

3d, 13th and 23d of each month.

When any of the above date fall on Sunday, the steamer will be dispatched on the following Monday.

A. B. FORBES, Agent.

## Wm. P. TAAFFEE,

IMPORTER AND JOBBER OF

**Staple and Fancy Dry Goods,**

**CARPETS, DUCK, ETC.,**

**CORNER OF FIRST AND MISSION STREETS, SAN FRANCISCO.**

**The First Established in the State.**

**MANUFACTURE STEAM ENGINES,**  
**SAW AND GRIST MILL MACHINERY, Boilers,**  
**Quartz Stampers, Amalgamators, etc., at reduced prices.** Have now the largest and best assortment of Gear and Machinery Patterns in the State, a list of which will be forwarded to anyone desiring it, free of cost.

PETER DONAHUE

## New Patent Agency.

**WE HAVE CONNECTED WITH THE** Publication of the "Mining and Scientific Press"

## The Patent Agency Business,

And would invite Inventors and Discoverers on the Pacific coast, who wish Dispatch as well as Economy to call upon us. We have an Experienced Agent at Washington, which, together with our own experience of several years, renders the

## Mining and Scientific Press Agency

The most desirable place to make application for Letters Patent on the Pacific coast. Apply at Office of the "Mining and Scientific Press," Room No. 27, Federal Building, corner of Battery and Washington streets, (directly opposite the Post Office.) San Francisco.

EWER & SMITH.

## FOREIGN PATENTS OBTAINED

By application at this office, Room 27, Federal Building. EWER & SMITH, Solicitors.

## NOTICE TO INVENTORS.

Inventors wishing to file Caveats should apply at this Office, Room No. 27, Federal Building. Terms moderate.

EWER & SMITH.

## PATENT RIGHTS.

**Patent Rights Bought and Sold,**

At the office of the "Mining and Scientific Press" Agency.

EWER & SMITH.

## IMPORTANT TO INVENTORS.

Inventors who obtain their Patents through this Office can have their Inventions illustrated and described in the columns of this paper FREE of charge, they merely furnishing the engravings. We are also prepared to furnish engravings at reasonable rates. Those who do not care to go to the expense of having engravings prepared can have their inventions fully noticed and described in our columns, free of charge. The free use of our columns to aid them in introducing their inventions to the public will be found a most important advantage to inventors.

EWER & SMITH.

## P. M. S. CO.

**PACIFIC MAIL STEAMSHIP COMPANY'S** line to PANAMA, connecting via the Panama Railroad with the steamers of the Atlantic and Pacific Steamship Company at Aspinwall.

## FOR PANAMA.

The following Steamships will be dispatched in the month of May, 1863.

May 13th, - - - - - Steamer Orizaba

May 23d, - - - - - Steamer Golden Age.

Will leave Folsom Street Wharf, with Passengers and Treasure, for Panama

AT 9 O'CLOCK, A. M., PUNCTUALLY,

And connect, via Panama Railroad, at Aspinwall, with steamships for New York

For Freight or passage, apply to  
A. B. FORBES, Agent.  
je4 Corner of Sacramento and Leidesdorff sts.

## Miners' Foundry

—AND—

## MACHINE WORKS,

**First St., between Howard & Folsom,**

**SAN FRANCISCO.**

**EVERY DESCRIPTION OF IRON AND BRASS MACHINERY,** the Best and Most Economical, manufactured in the state of California, will be furnished with dispatch at the Miners' Foundry and Machine Works, as:

Steam Engines and Boilers, Flower, Saw and Quartz mill machinery, Mining Pumps, Amalgamators, Retorts, Etc., Etc., Etc.

Particular attention will be given to the manufacture of Machinery in Sections, designed for places of difficult access. Various models of Quartz Crushers, Amalgamators and Water Wheels—some in operation and on exhibition.

\* Parties desiring to test their ores practically, in small quantities will be afforded ample facilities, free of cost.

All parties desiring accurate and highly finished drawings and Superior Machinery, at most reasonable rates are cordially invited to call before contracting elsewhere.

HOWLAND, ANGEL & KING.

San Francisco, February 23, 1863.

## PALMER, HANSCOM &amp; CO.,

## GOLDEN STATE IRON WORKS,

No. 19, First Street, San Francisco,

Furnish Castings and Machinery of all kinds

ALSO:

**GENUINE WHITE IRON SHOES AND DIES.**

PALMER, HANSCOMB & CO.

## To Quartz Miners.

**Knorr's Improved**

**AMALGAMATING PAN,**

WITH

**PALMER'S PATENT STEAM CHEST**

**THE ABOVE COMBINATION SECURES THE MOST complete amalgamation of the precious metals any process now known.**

By its steam is introduced in the most effective and economical manner, while it is peculiarly adapted to catching - floating gold and silver, known to be otherwise lost. Made exclusively by

PALMER, HANSCOMB & CO.,

GOLDEN STATE IRON WORKS,

Nos. 19 & 21 First Street, San Francisco

The public are informed that Letters Patent have been granted the undersigned upon Steam Chest False Bottoms for the inside of Amalgamating Pans or Tubes, and are cautioned against making, buying, using or selling the same without his consent.

W. A. PALMER.

Between Jackson and Pacific Streets,  
Established 1849. SAN FRANCISCO

All Goods Guaranteed. Orders Solicited  
TERMS LIBERAL. Jan. 1-1f.

## THEODOR KALLENBERG

## Maker of Models

FOR INVENTORS.

**MACHINES, MATHEMATICAL, Optical and Philosophical Instruments.** Scales, Weights, etc.; Stamp, Dies and Die Sinking, Embossing-Stamp. Repairing of Machinery promptly attended to.  
No. 4 Sansome street, corner Market, (n7.3m) San Francisco.

# Mining and Scientific Press.

W. B. EWER,  
EDITOR.

A JOURNAL OF MINING, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

EWER & SMITH,  
PROPRIETORS.

VOL. VI.

SAN FRANCISCO, MONDAY EVENING, MAY 25, 1863.

NO. 30.

## SPECIAL NOTICE.

We wish it distinctly understood that all the interest which Julius Silversmith ever had in the MINING AND SCIENTIFIC PRESS, ceased in November of 1862. EWER & SMITH are now the publishers and proprietors.

## THE COPPER MINES OF CALAVERAS COUNTY—INTERESTING LETTER.

COPPEROPOLIS, CAL., MAY 20, 1863.

MR. EDITOR:—I propose giving a few items from the Copper Mines of Calaveras County, which may interest those of your readers who have faith in this class of mines being made productive in California. There are many Californians who think that mines of copper can possess no value unless the ores are found in *concentrated lodes*. If the people of this State would only devote a little time to reading the report of the English copper mines, they would soon find out that concentrated lodes of copper ore are very rarely found, and that copper lodes do not produce one third copper ore.

The principal copper mines that I have visited in this county are the Union, Keystone and Calaveras at Copperopolis, and the Napoleon of the Gopher district. Not yet having had time to visit other mines in those localities, I cannot speak of their real worth, but report says there are quite a number of good prospects in the vicinity of the mines mentioned above.

### THE UNION MINE.

This mine is not surpassed in richness by any other copper mine in the world, as far as developed. The Company have developed their mine about 600 feet in length, and have three working shafts, 180 feet deep, and an engine upon each one. The lode varies in thickness, as all lodes do, from one to twelve feet, and will produce about 10 tons of 20 per cent. ores to the fathom (6 feet square). Two thousand tons of this class of ores could be easily taken from the mines monthly, by 100 miners; and this independent of a large quantity of 6 per cent. ores, which are mixed with slate, mudic and sulphurets of iron. These poorer ores can easily be concentrated up to 18 and 20 per cent. ores, the sale of which ought to pay all the working expenses of the mine. This company have now on the surface 5,000 tons of 7 per cent. ore, ready for concentrating, and have not yet *stopped* a foot of ground. The galleries from which this mass of mineral has been taken comprise a near extent of 600 feet. Persons acquainted with mining operations can readily calculate the number of tons of ore thus discovered and proved. I believe 300 tons of ore is about the amount of their present monthly shipments, which is less than their waste ores could be made to produce.

### THE KEYSTONE MINE.

This mine joins the Union on the East. The Company have a very fine lode, which can be easily traced the whole length of their claim.—3300 feet. They have two working shafts; one 260 feet deep and the other 140, located upon

each end of the mine. The lode in these shafts looks well. At the depth of 260 feet they have a fine lode of concentrated ores, six feet thick, which will assay about 20 per cent. as it comes from the mine. The work that has been done upon this mine, like that upon all others in this locality, has cost double what it ought to have been done for, in consequence of the employment of inexperienced superintendents; consequently the company has not yet paid any dividend. The mine has been worked entirely for lodes of concentrated ores, such as the Union mine produces. Such deposits are few and far between in this, as well as in most other mines the world over.

The expense of running drifts and sinking shafts to find deposits of concentrated ores has kept this company back from ranking with first class copper mines. The company has recently, however, made arrangements with a practical copper miner to take charge of their mine and erect "Concentrating Works." This party has had 30 years experience, as Superintendent of copper mines, and a concentrator of copper ore. We are quite confident that this mine, inside of four months, will be shipping from 400 to 500 tons of 20 per cent. ore per month. The new Superintendent will send to the surface the entire bulk of the lode, as it runs, and select the No. 1. Numbers 2 and 3 will go to the concentrating works and subsequently be returned as No. 1 ore. Thus every particle of copper ore will be saved and prepared for the market. Such a method of working will soon make the Keystone equal to the Ophir, of Washoe, in its yield of wealth.

Parties are now in your city negotiating for machinery, by which to concentrate ores and this Company will no doubt have in operation the first copper concentrating works on this coast. The mill will be in operation, probably, within four months.

### THE CALAVERAS COMPANY.

The mine of this Company—the 2nd western extension of the Union—has not yet been opened to any great depth. This Company has done most of its work upon the cropings of the lode; they find a superior quality of mineral, such as the black, gray and "horse flesh" ore—the latter a local term for the red oxide of copper. These ores are chiefly found on the back of the lode, never in large quantities, and not often deep down. They are good indications in a mine. The Company is shipping some ore, but not enough as yet, to pay expenses; neither will they do so for some time to come, unless they change their present mode of working.

### THE NAPOLEON MINE.

This mine has never been properly worked until quite recently. Until within a few weeks all the work has been done upon stringers and feeders, the main lode not having been struck until since the present Superintendent has had charge of the mine. Since the change in its management, the working plan has been so modified as to make it essentially a new mine. The main shaft is now 140 feet deep. The main lode or rather its *foot wall*, was struck in this shaft by the former Superintendent, but he was not aware of it, but passed on by it, timbering as he went down, and

commenced work upon some feeders, which were lying under the main lode. When the new Superintendent took charge, he ran a cross drift from the bottom of the shaft to strike the lode which his predecessor had neglected, and was rewarded by finding a well developed vein six feet thick, and of undoubted richness. A drift has now been run 78 feet upon this lode, and shipments of 20 per cent. copper are now being regularly forwarded to your city for transfer East. The Company has a large quantity of 5 and 8 per cent. ore on the surface, which will soon be concentrated. The Superintendent of this mine, who also has charge of the Keystone, informed me that he should be able to ship from 100 to 150 tons of ore per month, as soon as he had his drifts properly opened and in good order for working, which would be in a few months.

### CONCLUSION.

From the above notes, which have been hastily thrown together, your readers may be able to form a pretty correct judgment of the value of our copper mines in this section. Persons interested, and especially those working and superintending copper mines should bear in mind that it is not necessary that they should have lodes of concentrated, 20 per cent. ore, to make their mines pay. Give me a lode four feet thick, with the mass of vein stone averaging 6 per cent. of copper—I care not how much scattered it is throughout that mass—and I will guarantee to you dividends equal to the best paying silver mines in Washoe.

### COPPER MINER.

LABORERS WANTED.—From every part of the mining regions we hear complaints with regard to the lack of laboring hands. The unusual exodus of miners over the mountains, and the increasing interest which is being taken in copper mining on this side, appears to have completely absorbed the surplus labor—or at least all that is skilled in underground work. Wages, we understand, have materially advanced in many places, and it is found necessary to offer additional inducements, to keep men at steady employment, in preference to joining in the general rush for "prospecting" on their own account. In Del Norte county, we understand some of the mines are at a stand still for the lack of hands to work them. There is great complaint also of the scarcity of laborers in the Copper Mines of Contra Costa county, while gentlemen recently from the central and lower portions of Nevada county inform us that mining employers there have been compelled to make material advances in the wages of their hands to keep them from joining in the general rush for "new diggings." We hear similar reports from other sections. The present promises to be one of the most successful mining seasons on record. Large shipments of copper ore will soon begin to arrive in this city, and we are greatly deceived in present indications if this new branch of business, does not reach an important position in California industry, ere the present year is passed. There are hundreds of idle men about this city complaining that they have nothing to do, who might find good employment, at this time, in the mountains, and be of service both to themselves and the State in opening up the new avenues of wealth the existence of which their more enterprising neighbors have brought to their notice.

## OUR MECHANICAL INDUSTRY.

## Miners' Foundry and Machine Works

We visited this establishment a few days since and took a hasty survey of the premises. The increasing importance of the mechanical interests of this city may be very correctly estimated by the extensions of the working area of our various foundries and machine shops, and the evidences of this kind which we met at the MINERS' FOUNDRY, testify that this establishment is enjoying its full share of this increase. Large additions have been made to every portion of their working room and everything about the establishment has the appearance of order, convenience and thrift.

In addition to the usual mechanical appliances this foundry has been converted into a perfect Miners' Museum. Here may be seen almost every description of machinery employed for mining purposes not only in the various stages of manufacture and in completeness, but also in actual practical operation. We saw at work Wheeler's Amalgamator and Separator, Howland's New Freyberg Process (a new and valuable invention which we shall notice more fully next week.) West's Amalgamating Pan, Celeman's Pan, and four or five different Crushing and Grinding Machines, for working quartz, Mineral Paints, etc.

Fully alive to the great importance of the Mining interest the Proprietors of this Foundry have set apart commodious rooms for the especial use, and provided ample motive power for the working of their machinery, both to enable the inventors to exhibit practical tests of their several inventions and improvements, and also to afford miners and mine investors every convenience for testing their ores upon a practical scale here in the city.

Upward of 100 hands are employed in this Establishment. It has two furnaces capable of melting seven and a half tons of iron each. Single castings have been turned out at this Foundry, weighing six and a half tons. They are now constructing for the Real del Monte Company, at Aurora, a beam Engine of 100 horse-power. This Foundry also has the contract for the entire construction of the Mill for this Company. We examined the plan and drawings of the same which is to cost about \$100,000, and which will be one of the finest works of the kind on the Pacific Coast. The Mill will be 160 feet long by 60 wide, with a brick smoke stack 70 feet high.

This Foundry has also recently constructed and put in operation the Wide West Co's new Mill. They have also lately shipped the machinery for S. C. Fogus & Co's Mill, which is now in progress of construction, as a custom mill at Aurora. This is a 12-stamp steam mill, and will use 8 Wheeler Pans and 3 Separators.

They are also at work upon a mammoth amalgamating pan of West's Patent, which is 24 feet in diameter.

We have received a copy of the annual circular of this firm, containing their advertisement, illustrations of various machinery manufactured at their establishment, and a large number of valuable mechanical tables, rules for mensuration, etc.

We shall endeavor to look in upon some other establishments and take a few notes in season for our next issue.

## Copper Ore—The California Smelting Works.

The Secretary of the California Smelting Works, gives the following schedule of prices which the Company will pay for copper ores delivered at their wharf at Antioch:—

7½ to 8 per cent.....	\$15 per ton of 2,376½ lbs.
9 per cent.....	17 " "
10 per cent.....	19 " "
11 per cent.....	21 " "
12 per cent.....	25 " "

and in the same ratio for ores of higher assay. The ore is estimated by the usual smelting ton of 2,376½ lbs. dry weight

When desired the Company will advance all expenses of freight and transportation from the Mine to the Works. The ore may be sent in bulk or in bags, which will be returned. Payment will be made in gold as soon as the value of the ores is ascertained by the assay of the Metallurgical Chemist of the Company.

An architect proposes to build a Bachelors' Hall, which will differ from most houses, in having no eaves.

## Notes of a Trip to Slate Range via Los Angeles, Tehacapa, and El Paso.

[We give below the first of a series of letters which will be furnished by an intelligent correspondent, who left this city some two months since, for an exploring expedition through the Slate Range Mining District. The notes of travel, given in the present letter, will be interesting to parties who may think of visiting that region, and the subsequent letters, descriptive of the mines, etc., will, no doubt, be found truthful and valuable.]

## THE DEPARTURE.

SATURDAY, MARCH 28, 1863. Having bid farewell to our wives, children, sweethearts, and friends in Alameda and Oakland, our party, consisting of two strong limbed and strong hearted young men and myself, crossed over to the city, made up our final purchases of such articles as we supposed the trip required, limited to some extent by the scarcity of coin, sent them on board the steamer, spent the evening with some friends, took our last sleep in San Francisco, for one or two years to come, perhaps, and on Sunday morning at 9 o'clock stepped on board the fine steamer Pacific which took the place of the disabled Senator, and in fifteen minutes her loud mouthed bull dog belched forth his parting compliments to the just awakened denizens of the Golden City, and we were fairly started on our long journey to the far distant silver mountains of San Bernardino county.

## THE TRIP DOWN THE COAST.

But few incidents occurred upon our trip down the coast. The weather was very fine, but after passing the Gate the steady regular swell of old Ocean's bosom, caused a curious sensation about the gastric region, which prevented us from appropriating our rations for the balance of the day and even made a demand upon us for our breakfast. Determined to become acquainted with coarse fare and limited accommodations as soon as convenient, at night we took our blankets and made our way to the sleeping apartments devoted to the forward passengers. These we found commodious, each with a good clean mattress, and the only drawback was the fixidness of the bull eyes which should have afforded us some ventilation. On appealing to the steward, he informed us that the orders were peremptory in regard to that matter, and I suspect they were given while the steamer was engaged in a higher latitude and had not been revoked.

On the following morning, our appetite having returned, we obeyed the call to breakfast, but were somewhat checked on finding the table nearly surrounded with Chinamen, outnumbering the white folks considerably. Some of our party gave unmistakable evidence of their disgust at this arrangement, in plain English, but the writer said nothing, as the Johns were as cleanly in their dress and manners as any at the table, and determined to put up with anything within human endurance, rather than find fault. But the fare was really execrable and by those present who had traveled on the Senator, was said to be very far inferior to hers. We made out to reduce a little of the very tough fried beef, hard bread and molasses, and sweetened coffee, and then resorted to our own grub box for a nice soda biscuit and a ginger snap to finish our meal, with a cup of good water of which there was plenty on board.

Late in the evening of the second day out, as we were promenading the upper deck, a young man approached us with a book in his hand, accompanied by another holding a lantern, and asked for our fare (\$15) which we paid; but some poor fellows who were dozing in some of the obscure corners of the vessel, missed, I am quite positive, the kind attentions of these gentlemen. Good enough for them. They should be around on such an important occasion. One of our passengers who had been in Uncle Sam's employment as a teamster, was there, on his way to join a portion of the Army on Owens' River, if I remember rightly, had only green backs on hand. He offered three fives for his fare, but they would not take less than four. He refused to give more than three, and was told they must take his sack of clothing. "All right," said he, "and perhaps you had better take my blankets also." "Yes, we will." Said he, "I can get them again when we arrive at San Pedro." Poor fellow! He did not succeed; but waited till the steamer returned from San Diego, then went on board, paid his full fair in coin and took his baggage. He found it too

big a job to resort to law, against the Company, though he might eventually succeed, perhaps.

TUESDAY, 31st. Arrived at anchorage in the Bay of San Pedro, at 4 A. M., at a little outside Deadman's Island, and soon found ourselves surrounded with yaws and barges to convey passengers and freight to Tomlinson's Landing, (Old Town, and a pretty little steamer belonging to Col. Banning, to take those who preferred to New San Pedro.

## ON SHORE—OLD AND NEW SAN PEDRO.

We being acquainted with Mr. Tomlinson's reputation for urbanity and kindness to strangers, took passage in his boat and found all we had heard verified. We stayed with him till next morning, enjoying the leisure hours in helping him and his men to unload and stow away freight, and between the trips he would recount some of his adventures with Indians and bears while teaming in different parts of this State, Oregon and Mexico. He, I think, is the bell teamster of California, having for many years, the greatest amount of stock on the road. His horses and mules are continually running on the roads with freight from his warehouses in Old Town and Los Angeles to the Colorado, Slate Range, El Paso, Owen's River, Coso, Anrora and everywhere else, with machinery and the necessities of life for those who toil among the unlimited mining districts of our State and Nevada.

Old San Pedro is a small village consisting of Mr. T's warehouse, his boarding-house and a grocery kept by a German, close by.

New San Pedro appears to be a very pretty village, pleasantly situated at the head of the Bay, about 2½ miles from Old Town; approachable with boats only at certain stages of the tide. The indomitable energy of Col. Banning and his associates will no doubt continue to make it the town on the Bay.

Camp Denver is located there which adds much to the life of the place.

WEDNESDAY MORNING, APRIL 1st. Packed our freight on mule teams and at 10 A. M. started on foot for Pueblo de Los Angeles (the city of the angels.) On leaving the beach we ascended a high, sharp bluff and at once the eye took in the whole vast plain to the mountains about twenty-five miles distant, with the city at the base and which would be visible from a slight elevation. This plain at this time presents the appearance of a great desert, not a tree or shrub, but occasional patches of a weed which in our younger days we called cheese plant, and which stock do not seem to relish, even when their supply of grass and clover is exhausted thus early in the season. Stock of all kinds is now being driven back to the valleys and gulches in the mountains to avoid starvation. It is expected that the losses will be very great, on account of the small supply of water which fell last winter.

On this dreary walk we came upon a Rodeo in full operation and had a good opportunity for the first time to witness the manipulation of the hombres, on this annual occasion, in lassoing, throwing, branding the young stock and hunting off each man's animals by themselves so that he may take an account of stock, make out his invoice and take his place in the property scale to which he is entitled.

By actual observation we became convinced of the oft repeated assertion that ground squirrels, owls, and snakes live together in harmony. Large squirrels were moving ahead of us in all directions, about twenty yards distant and sometimes 100 would be counted in sight. We saw the owls sitting by the squirrels holes and disappear as we approached and snakes would occasionally follow them and lizards and horned toads (of which we saw some beautiful specimens, all seemed to have their homes with the snakes.

## A WEEK IN LOS ANGELES—THE START FOR THE MINES.

Arrived in Los Angeles in the evening and camped in the spacious storage yards of Tomlinson & Co., occupying fifty vara lot enclosed with an adobe wall seven feet high the front filled with adobe houses and offices, one side arranged with stalls for horses and mules, the other piled with lumber kept for sale, and the centre filled with their great wagons and stages.

We here enjoyed our first experience in sleeping in the open air, and it was not a pleasant sensation, but we soon became accustomed to it as the novelty wore off.

Finding no teams loading for Slate Range, we amused ourselves in looking about town and wandering into the

country among the vineyards for which this place is justly famous. Plenty of orange orchards were to be seen but no fruit. The vineyards presented a very bad appearance, the stem though from ten to twenty years old being only about three feet high, consisting of two or three branches and each branch having only one spur or bud upon it. The leaves were starting out on some of them, but the grass and weeds between the rows had not yet been disturbed and together with the scraggy stumps presented a desolate appearance.

The arrangements for irrigation about the city are very fine, the Los Angeles River being conducted in small channels, so that all can have the use of it by turns, twice during the season I believe being the general rule. The streets of Los Angeles generally present a somewhat lively aspect, particularly around the principal hotel, Belle Union and where the heaviest dealers in merchandise are located. A few fine brick blocks are up and well filled in with goods, and the market house with its fine turret clock and the court house, tend to give it an American appearance; but the many low adobe dwellings, with their heavy walls and no windows or an occasional opening checkered with iron bars, tells plainly that the old Spanish ingredient still occupies a prominent place in society.

I remained in Los Angeles over a week and such a dull week never fell to my lot before. Once the mail arrived from San Francisco and that was a great relief, though it required only a few minutes to appropriate all the Daily Alta served up—which was the only paper I saw. On all occasions in Los Angeles when we replied to the question "What mines are you bound for?" "Slate Range," the enquirer would open his eyes with wonder and exclaim, "I thought Slate Range was 'played out'! Why don't you go to Soledad, Colorado, or El Parso?" But Slate Range was our goal and there we would go.

On Tuesday, 7th, we found an ox team would start for Slate Range the next day, under the charge of McGuffy, and loaded with corn, lumber tools and supplies for the Fernando Mill Company. So we offered our services to Mr. McGuffy, as ox-drivers, or bull punchers, as they usually call themselves. He accepted one at low wages and would take our freight at 8 cents a pound, making no charge for personal baggage and blankets, and we could ride when we chose, on easy grade. So we closed and started out Wednesday morning, April 8th, at 10 o'clock, and walked 6 miles to Mr. Mayhew's ranch where the cattle were to remain over night to fill themselves before commencing the journey over the dreary deserts and mountains before them.

Mr. Mayhew invited us in, and we passed a pleasant hour with him. He is a candid Alabama Southern sympathiser and feels somewhat annoyed at the prospect of being drafted to fight in the northern ranks. Thinks that a regiment such as he would make poor defenders of the North. I agree with him fully. Yours &c. C. W. G.

#### TO MINERS AND PROSPECTORS.

In view of the frequent accidental discoveries of valuable mineral deposits, other than gold, in almost every section of the State, which have of late been made, it is but reasonable to suppose that prospecting even in California, has but just commenced. The simplest and most universal of all metalliferous deposits is gold. It rarely occurs in any other form than that of "free gold" which is readily discernable to the naked eye. An examination of any rock or earth for gold is an extremely simple process. If its presence is suspected in alluvium, the simple washing of that alluvium in a pan is an invariable test. If in rock of any description; that rock pounded fine in a mortar and washed, in the same manner as alluvium, will usually expose its gold to the naked eye, if there is any there in paying quantity. The only exceptions, are where the gold is contained in iron pyrites, or copper pyrites containing also iron. In either of the two latter cases the presence of gold may be readily ascertained by placing the pyrites in any suitable vessel and keeping the contents at a moderate heat for from four to six hours, with frequent stirrings, by which means the sulphur will be evaporated, and the copper, if any is present, changed to a dull red color, and the gold retaining its natural appearance, on subjecting the whole to the usual panning process, may be readily seen by the naked eye.

Not so with other metals. Silver, copper, zinc, nickel,

and many others appear in such a great variety of metalliferous forms as generally to defy all but the most practical and scientific eye. No description of these ores can be written which will afford any very important aid to the inexperienced in making explorations. After reading descriptions, however, and carefully examining the specimens described, the explorer may go out and search with some degree of confidence and intelligence. A study of the characteristics of the sulphureted ores alone, would lead an explorer to pass over, entirely unnoticed, the richest varieties of the ores known as Chlorides or Horn Silver, which, from the facility with which they may be worked, and their usual richness, are generally considered the most valuable of silver ores. There is much reason to believe that this variety of silver ore will be extensively found in all the volcanic regions of this State. So with many other ores.

Considering the great difficulty, in the present lack of cabinet collections, and other means of instruction, to acquire a practical mineralogical and geological education in this State, and desirous to aid, to our fullest capacity, the development of our mineral resources, we hereby make the offer to miners, prospectors and all others, who in their travels or explorations may come across specimens having the appearance of rarity or value, to carefully examine and pronounce upon the same, free of charge, as to their characteristics, value, etc., whenever any such specimens are brought or sent to this office free of cost to us. We have already been called upon in many such cases, and we shall at all times be willing to give our attention to any such requests which may be presented to us.

In carrying out the plan we propose, every miner and prospector should be at all times on the lookout for any new mineral. The ordinary rocks with which the miner meets in his travels and labor, and which possess no mineral value are usually well known. Whenever a rock presents any unusual appearance in conformation, color or other characteristic, attention should at once be given to it. There is scarcely a piece of quartz or rock of a quartzose nature, which presents any uncommon appearance in texture or color that has not been thus modified by the deposit or intrusion of some mineral substance. If such rock is found upon or near a vein of quartz it should be carefully examined "in place," and if the cause of its peculiarity is not evident and readily seen, it should not be passed carelessly by. There may be value in it, although the gold may not shine there. We shall commence in our next issue a series of articles describing as accurately and as intelligibly as possible all the ordinary mineral substances which may be likely to come under the notice of the California prospector. These articles will be published under the head of "THE MINER'S LABORATORY," and will be found of great value to the mining public. [*Mining and Scientific Press*, April 20.

**SUBSCRIBE.**—Are you a miner and not a subscriber to the MINING AND SCIENTIFIC PRESS? If so, you are an annual loser of many times the price of a year's subscription, particularly if you are engaged in quartz mining. The same amount of practical information, important to miners and mechanics, which is contained in a volume of the PRESS, cannot be bought from the shelves of any bookstore in the country for the price of several year's subscription. Do you ever send a paper to the "Old Folks at Home?" If so, and you desire to send important information and valuable reading matter, you can find no paper that will be read with so much eagerness by them, or one that will convey to them so full an account of the real industry of the country as the MINING AND SCIENTIFIC PRESS. We invite all to send us their names and *four dollars*, or *two dollars* for six months, and become patrons of the only mining paper printed on the Pacific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examination, and with the hope that it may so for meet with their approval as to warrant their subscribing for it at once. It is not our usual custom to receive a subscriber for less than six months; but inasmuch as we are anxious to introduce the paper where it is not now known, we will, for the present, send the PRESS for three months even, on the receipt of one dollar, in coin or stamps. It is our belief that no one will wish to discontinue the paper after being a constant reader of it for even that short period.

## Mining and Scientific Press.

The MINING AND SCIENTIFIC PRESS is published at the Exchange Building, Room 27, corner of Battery and Washington streets San Francisco, Cal., at FIFTY CENTS per month, or \$4 per annum, in advance.

C. W. M. SMITH and W. B. EWER, - - - - Proprietors

#### Engravings, Electrotyps, etc.

We execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. SKETCHING and ELECTROTYPING. Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing. Job Work executed with dispatch at low rates. PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

### To Printers.

AN INTEREST in one of the most flourishing and best paying Newspaper Offices in the mountains is offered for sale on easy terms. A rare opportunity is hereby presented to any printer desirous of establishing himself in a good business in one of the healthiest, most thriving and delightful mountain towns in the state. For further information enquire at this office.

#### MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

THIRD YEAR! VOLUME VI.—NEW SERIES!

A new volume of this extensively circulated paper commenced Sept. 11, 1862. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

#### The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

#### The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

#### The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

#### To Chemists, Architects, Millwrights and Farmers!

This Journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

#### Terms.

To mail subscribers:—Four Dollars per annum.

#### Club Rates.

Five Copies for Six Months, \$8.  
Ten Copies for Six Months, \$16.  
Ten Copies for Twelve Months, \$30.  
Fifteen Copies for Twelve Months, \$44.  
Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2.80. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

#### EWER & SMITH, Publishers,

Room 27, (formerly) U. S. Court Building, Corner of Washington and Battery streets, San Francisco.

#### Our Mint, its Rules, Charges and Operations.

#### For parting silver from gold when gold

is below 300-1000ths. fine ..... 3cts per oz.  
" from 30-100ths. to 750-1000ths fine. 7 cts " " oz.  
" " 750-1000ths to 950-1000ths " 14 cts " "

#### DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce  $\frac{1}{2}$  per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300 3cts. per oz. gross weight  
301 " 500, 7cts, " " " "

#### DEPOSITS FOR FINE BARS

\$1 16-4-11ths. cents. per standard ounce,  $\frac{1}{2}$  per ct. gross value of silver for making bars; also when gold is contained  $\frac{1}{2}$  per ct. on gross value of gold for coining. Refining charges as in purchases.

#### BARs SOLD FROM REFINERY.

\$1 21cts. per standard oz.  $\frac{1}{2}$  per ct. gross value to be added for making bars.

#### DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz.  $\frac{1}{2}$  per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

#### DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz.  $\frac{1}{2}$  per ct. gross value of deposit for making bars.

## THE MINERS' LABORATORY.—NO. IV.

## THE GEOLOGY OF COPPER.

FRANCE affords but one workable mine of Copper. Numerous mines have been wrought at various periods in the past, but, we believe, with the above exception, they have all been abandoned. The copper veins of this country are everywhere found associated with aluminous slates, more or less metamorphic, and among which, at frequent intervals, porphyritic rocks have been protruded. The mines at Chessey are directly at the line of junction of the granite and lias, (the latter a species of limestone.)

GERMANY.—The Copper Mines of the Hartz mountains occur in grauwacke slate into which numerous belts of trappean rocks have been obtruded. The mines of Rheinbreitenbach are in the same character of formation, and are productive in pyritous and variegated copper.

SPAIN.—The general character of the deposits of this metal in Spain, is similar to those of the Hartz mountains.

In the Province of Hueloa is a district of much mineral wealth, the formation of which is clay-slate, traversed by numerous porphyritic eruptions, and it is near the line of contact of the slates and porphyry that nearly all the metaliferous veins occur—the most valuable being directly between the two formations, having a wall of schistose slate on one side and porphyritic granite on the other; the former usually composing the south wall and the latter the north wall of the veins. The veins are often found with both walls of porphyry, and sometimes, though unfrequently, with both of slate.

PRUSSIA.—In the vicinity of Mansfield, in Prussia, an interesting deposit occurs, known as the "Keeperscheifer," or copper slate—a thin layer of which occurs in magnesian lime stone. Throughout the entire body of this "copper slate" is disseminated gray argenteriferous copper ore.

Near Schemnitz, in Hungary, is an interesting metalliferous region, which produces about 5,000 tons of copper annually. The veins of this district are found altogether in porphyritic rocks, connected with sienites and passing into granites. The predominant vein rock is quartz and sulphate of barryta. The ores are pyritous and gray copper.

NORWAY AND SWEDEN.—The veins of these countries are almost exclusively confined to the gneiss and mica slate, more or less metamorphic from subterranean heat. The copper from this region is highly esteemed in consequence of its purity and freedom from arsenic and other metals.

RUSSIA.—The copper deposits of Russia, in the Ural Mountains, are also remarkable for the purity and richness of their ores. The copper ores of this region are found chiefly in thin veins and nests of malachite, which lies in a broken, unconsolidated mass of detritus, overlying the surface of the upturned edges of lime-stone strata, intermixed or rather intercalated with ridges or ledges of trappean rocks. This malachite, though not in immediate contact with trappean rocks doubtless owes its origin, indirectly to igneous action, being probably a secondary product resulting from cupriferous sublimation, accompanied by stalagmite deposition.

CUBA.—The copper deposits of Cuba, like those in the Ural Mountain region, are not in regular veins, but in beds and masses, in immediate connection with igneous rocks, such as greenstone and serpentine. The gangue of these deposits is composed of quartz and common white marble. The ore consists chiefly of yellow sulphurets, although blue carbonate of copper is not uncommon.

CHINA.—The copper mines of this country are very numerous and of great value. They exist chiefly in metamorphic granite, with veinstone of quartz and Jasper.

IN AUSTRALIA the mines of copper are situated in an association of rocks quite similar to those formed in the Cornwall copper districts. The Barroosa district is in mica slate, similar to the Killas (slates) of Cornwall. Through these slates, as in those of Cornwall, granites and sienites have been protruded, at frequent intervals. On the Copper Mine River, the enclosing rock consists of trap and stone, with occasional layers of limestone.

IN LOWER CALIFORNIA and Carmen Islands, we learn from verbal communication that the enclosing country of the copper veins consists almost altogether of igneous rocks.

From the above data it will be seen that copper ores are

found in almost all positions, from the most recent clay slates and detritus to granites, but invariably either in actual contact with or in the immediate vicinity of igneous or metamorphic rocks. Perhaps no metal presents more uniform evidence of an origin derived from an igneous agency than copper in its various ores. Of its origin we shall speak at a future time.

With the exception of iron no metal, used extensively in the arts, is more generally distributed than copper. There is scarcely a known country on the globe where it has not been found in workable quantities.

It is hardly necessary that we should occupy space in a journal for California readers, to direct them how to find or trace a mineral vein; yet a few brief hints to aid the prospector in determining when he has found a copper vein may not be out of place.

## TO TEST COPPER ORES.

Perhaps there is no characteristic of copper veins so general as their color. Whenever a mineral of a green or blue color is met with the presence of copper may be reasonably suspected.

A very simple and ready method to test the presence of copper in any ore is to drop a little nitric acid upon it, and after a short time dip a feather into the acid, and wipe it over the blade of a knife. If there be the least quantity of copper in it, the same will be precipitated on the knife. Perhaps a simpler mode than this cannot be named.

A blow-pipe test may readily be made as follows:—Place a small piece of copper ore, with a little borax on a piece of charcoal, and apply the flame of a blow-pipe, when if any copper is present it will soon show itself in a small globule.

Again take a small quantity of the ore and pulverise it; place the powder in a small vial, add three or four times its bulk of nitric acid, which will soon dissolve the powder; then add a little water, and dip the point of a knife, or any piece of bright iron into the liquid. If copper is present the iron will be found coated with it.

## CHARACTERISTICS OF COPPER ORES.

The ores of copper are quite numerous and present a great diversity of appearance, yet they are all very readily distinguished, each from the other, by certain unmistakable characteristics, which are rendered familiar by a very little attention. The presence of copper in any ore having been determined by the "tests" above given the character of the ore can, in most instances, be determined by the following description:—

The ores of copper are divided, by metallurgists, into 13 different classes, and each class is subdivided into many varieties. The richest of the ordinary ores appear under two general aspects: the first having a metallic lustre of copper red, brass yellow, iron or blackish gray, at times inclined to blue; the second is without metallic appearance, of a reddish color, verging upon purple, blue or green, the last being the most usual tint. The classes of ore most frequently occurring are Native Copper, Sulphuret of Copper, Copper Pyrites, Gray Copper, Sulphate of Copper, Carbonate of Copper and Arseniate of Copper. The most common are sulphurets and oxides, the former being the most abundant.

Sulphuret of Copper occurs in all considerable copper districts, and is very abundant in California. The color of this ore is a blackish lead gray, approaching, at times to tarnished blue or green. It is considered one of the richest ores, and generally occurs in very heavy veins.

Copper Pyrites greatly resembles, in appearance, sulphuret, of iron, common in the gold bearing quartz of this State. The color of the Pyrites is brass yellow, subject to tarnish, with greenish black streak and uneven fracture.

Copper Pyrites are readily distinguished from iron pyrites, which they greatly resemble, by their inferior hardness; they may be cut with a knife, while iron pyrites will strike fire with steel. A marked difference may also be noticed in the effects of nitric acid upon the two substances. They do not form so rich an ore as sulphurets. The richness of the pyrites may generally be judged by their color. If they present a fine yellow hue, and readily yield to the hammer, they may be considered a good ore; but if they are hard and of a pale yellow color, they are mixed with iron pyrites, and consequently comparatively barren of copper and constitute a poor quality of ore.

Carbonate of Copper is of a blue or light green color, with

pale green streak. It often occurs in beautiful green crystals. It is also known as Malachite. Green Malachite or Green Carbonate of Copper admits of a high polish, like marble, and when obtained in large slabs, is often formed into tables, mantle pieces, etc.

Arseniate of copper is of various shades of olive green, and sometimes occurs in beautiful blue crystals. It readily melts between the blow-pipe, throwing off fumes of garlic odor. This ore is but little worked.

Gray Copper ore is of a steel gray color, more or less deep, either bright or dull. The value of this ore is often very materially increased by reason of the silver which it contains.

It is generally accompanied, to a greater or less extent with copper pyrites.

Sulphate of Copper (Blue Vitriol,) is similar to the artificial salt of the laboratory. The water flowing from mines of this ore is of a blue tint, caused by the solution of this salt.

Copper is easily obtained from this water, in a metallic state by depositing pieces of scrap iron in it.

The ores above named are about all the ores of copper which are worked to any extent.

The copper of Lake Superior contains about 3-10ths of one per cent of silver. The copper of this State, mostly if not all, doubtless contains an appreciable quantity of both gold and silver. Of this we shall probably receive more definite knowledge when full returns are received from ores which have been sent East for reduction. A little metallurgical knowledge will be found of vast importance to the miner everywhere, and especially in California, where the mineral deposits assume such unprecedented profusion. Our miners according to present indications, will soon become as familiar with copper ores, as they have, for the last ten years, been with gold.

COPPER MINING.—We would call the especial attention of those of our readers, who are interested in copper mining, to the letter of our Calaveras County correspondent, who writes over the signature of "COPPER MINER." He is a gentleman of much practical experience in working and concentrating copper ores, having been thoroughly schooled, in that business, both in Cornwall and in the Lake Superior copper region. He has taken the liberty to criticise pretty freely upon some of the past working in the mines which he has visited. Of course he is responsible for what he says, and even if he may err in judgment, in some cases, no evil need to come of it. A fair open criticism and description of our mines and mining operations is what we want. It is the only way to obtain practical information, such as will lead to progress and success in mining enterprise. We want information with regard to processes and modes of working, both in the mill and mine. We are promised other letters from our Calaveras correspondent. We trust and believe they will be read with interest and profit. If any parties should think they have been unjustly criticised or spoken of, our columns are open to reply. Discussion is pretty sure to elicit truth and that's what we want. We shall give some valuable and practical information with regard to the mode and processes for concentrating copper ores, as soon as we can secure the necessary data, which will be within two or three weeks.

SPECIMENS FROM HUMBOLDT.—We have examined some specimens, handed in by Mr. Trotter from Union City, from the Cassius Company, Brutus Ledge, which was mentioned by our Humboldt correspondent of last week. The specimens before us were received a few days since and look well for both gold and silver. Assays from this Company's ore range from \$171 to \$1000; taking the lowest and the highest figures, a small percentage of which is gold. The Cassius is an incorporated Company. F. R. Jenkins is Sec. and M. D. Howell, Prest.; Office W. B. Cook & Co's Stationery store Montgomery Street. The Company are now making arrangements for properly opening the ledge, with a view to the commencement of active operations.

MORE DIVIDEND-PAYING COMPANIES.—The Daney Gold Silver Mining Co., Devil's Gate District, N. T., pay a dividend of \$14 a foot to day. The Union Gold Mining Company (Howland Flat, Sierra County, Cal.) announce a dividend of 3 per cent. on their capital stock.

WE notice the removal of our friend A. J. MOULDER, Esq., Stock Broker, to a spacious Office, No. 605 Montgomery St. which place has been nicely fitted up for him, with R. C. PAGE & Co.

PALMER, HANSCOM & CO.,

**OLDEN STATE IRON WORKS,**  
No. 10, First Street, San Francisco,  
British Castings and Machinery of all kinds

ALSO:

**GENUINE WHITE IRON SHOES AND DIES.**  
PALMER, HANSCOM & CO.

**To Quartz Miners.**

**Knox's Improved  
AMALGAMATING PAN,  
WITH  
PALMER'S PATENT STEAM CHEST.**

THE ABOVE COMBINATION SECURES THE MOST  
complete and efficient of the precious metals of  
the process now known.

By its steam is introduced in the most effective and eco-  
nomical manner, while it is peculiarly adapted to the  
sliding floating gold and silver, known to be other-  
wise lost. Made exclusively by

PALMER, HANSCOM & CO.,  
GOLDEN STATE IRON WORKS,  
Nos. 19 & 21 First Street, San Francisco

The public are informed that Letters Patent have been  
granted to the undersigned upon Steam Chest False Bot-  
toms for the Inside of Amalgamating Pans or Tubs, and  
cautioned against making, buying, using or selling  
the same without his consent. W. A. PALMER.

**VULCAN IRON WORKS CO.**  
TORQUET.....MANAGER.  
R. IVERS. C. R. STEIGER. S. AITKEN.

**Steam Engine Builders,  
Boiler Makers, Iron Founders and Gen-  
eral Engineers,**

No. 137 & 139 First Street, - - - - - SAN FRANCISCO.

STEAMBOAT MACHINERY built and repaired; also Saw,  
and Quartz Mills, Pumping and Mining Machinery,  
etc., etc., etc.

Proprietors of Morse's Patent Fire Grates,  
VAL, FOURSEYTON and other Turbine Water Wheels  
with latest improvements.

**DEETKEN'S  
Chemical and Metallurgical Works,**  
On San Bruno Road, Islais Creek,  
SAN FRANCISCO.

**GOLD BEARING SULPHURETS WORKED AT REAS-  
ONABLE PRICES. ALL THE GOLD EXTRACTED BY CHEM-  
ICAL PROCESS. Yield of Sulphurets from 20 to 50 per cent  
higher than the BEST AMALGAMATION PROCESS.**  
Apparatus for separating Sulphurets set up by ex-  
perienced hands at a cost of \$50 to \$100, if desired by  
owners. No power nor clean water required for  
purpose. nov8-3m

**LEWIS COFFEY AND RISDON,  
TEAM BOILER AND SHEET IRON  
WORKS.**

**THEODOR KALLENBERG  
Maker of Models  
FOR INVENTORS.**

**MACHINES, MATHEMATICAL, Optical and Philosophi-  
cal Instruments, Scales, Weights, etc.; Steel  
stamps, Dies and Die Sinking, Embossing Stamps.  
Repairing of Machinery promptly attended to.  
No. 4 Sansome street, corner Market,  
(7.3m) San Francisco.**

**Volcanic Smelting Furnace.**

PERSONS DESIRING INFORMATION AS TO THE USE  
of a patented process of the furnace, and in-  
tending to make use of the same, when satisfied of its  
superiority over all other means of reducing ores and  
separating metals from the sulphurates, can obtain all  
needed explanation and advice in regard to the same, and  
the terms of sale of rights to use the same, on application  
to J. D. Stevenson or T. Ogg Shaw, or by letter to the  
proprietors through the Post Office at San Francisco.  
Drawings may be seen at the office of Col. J. D. Stevenson,  
No. 614 Merchant street, or at the office of T. Ogg Shaw,  
in Brannan's Building, Montgomery street.

The time required for reducing ores by this Furnace  
is from three to eight hours, and the amount of fuel only  
one-tenth as much as is consumed by other processes.

The process of condensation is applied to this Furnace  
which will save all those portions of precious metals  
which usually escape in a volatile form.  
The attention of all interested in the subject is requested  
to examine the important results obtained by this pro-  
cess.

Parties wishing will be allowed to erect a trial Fur-  
nace of a capacity for smelting one ton of ore or more, on  
signing an obligation to pay the usual fee for the right to  
use it, should they continue to make use of the invention  
or a longer period than two months.  
Feb 16 MRS. E. J. WALL, M.D., Proprietress.

**New Style of Lady's Buckle.**  
W. BOHM, INVENTOR & PATENTTEE

THE SUBSCRIBER HAVING OBTAINED LETTERS PAT-  
ent from Washington for an improvement in the  
construction of Ladies' Buckles, is now ready to fur-  
nish the same in every variety of style. This buckle  
possesses several very important improvements over any  
other in use.

The invention having been carefully examined at the  
Patent Office, has been adjudged to be a useful improve-  
ment, and Letters Patent have been granted for 17 years.  
It excels all other buckles in

**Usefulness, Strength and Appearance.**

The Public is respectfully invited to call and examine  
this Buckle at the Jewelry Establishment of

DRAVEYMAN & LEVY,  
621 Washington Street, San Francisco.  
JOSEPH BROTHERS,  
607 Montgomery Street, San Francisco.  
FLOBERG & CONRAD,

**THE SIMPLE, COMPACT, STRONG AND**  
effective manner in which it is applied to any height of  
fall, (3 feet to 300,) and to any kind of machinery, will  
Save in Transportation, Material and Labor, from  
25 to 60 per cent. of the entire cost of the  
Structure to which it is applied, and propor-  
tionally increase its value.  
For full information from the Inventor, apply at the  
Miners' Foundry, from 10 to 11 A. M., or address  
J. M. BETH.  
Miners' Foundry, San Francisco.

This Wheel is fully GUARANTEED. Jan 19-1f

**To Mine Owners.**

**PARTIES having a Good silver Mine**  
and wishing for  
Machinery to work it for an interest in the Mine  
Will do well to apply at this office. No organized com-  
pany need apply.

**50 lbs. MARINE and  
Fire-Proof Paint,**

**MANUFACTURED BY THE PACIFIC METALLURGICAL  
Works in this city, for Hulls and Decks of Vessels,  
iron ground. Mineral Rock contains Arsenic, Copper, Li-  
tharge and six other Minerals. When used on the Decks  
or Bottoms of Ships, it is equal to a coat of Stone, and  
quite equal to Copper, no worms will ever effect it, and  
cheaper than any other paint.**

**DIRECTIONS:**

For Decks of Ships, use two parts Mineral Paint, one  
part White Lead, mix with Linseed Oil.  
For Bottoms of Vessels, use one part ground sulphur  
three parts Mineral Paint, mix with Coal Tar and apply  
it hot.

For sale by all Ship Chandlers and Tradesmen, in boxes  
of 50 lbs. each, or by the Pacific Metallurgical Works.

**25 POUNDS FIRE-PROOF PAINT.**

When used on Roofs, Buildings, or Fences, it is equal  
to covering them with a coat of Stone, being perfectly  
Fire Proof, and costing less than any paint.

**DIRECTIONS:**

**HOUSE:**—Mix three parts Mineral Paint with one part  
white lead, thin with Linseed oil; if a lighter color is  
wanted, mix less paint, more lead.

**ROOF:**—Five parts of Mineral Paint, one part white  
Lead; mix with Linseed oil. Put it thick on a tin Roof  
as one coat when properly applied will last three years.  
S. C. BRADSHAW, Agt.,  
G. T. FOUQUE, Superintendent.

**WORKS, North Beach; Office, 318 Cal-  
ifornia st., San Francisco.**

**WRIGHT'S PICKS.**

**JOHN WRIGHT, of Sacramento, has established him-  
self in San Francisco for the manufacture of every  
description of PICKS, of the best material, at reduced  
prices. Pick Eyes of the best iron furnished in any quan-  
tity, at low rates. Orders from the country promptly  
attended to. N. B.—None genuine unless stamped with  
my name. JOHN WRIGHT, 511 Market street,  
Opposite Battery, San Francisco.**

**WHEELER'S**  
**Amalgamating and Separating Pans.**

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of triturating, and in cleaning up. By the introduction of the Separating Pan to follow the triturating this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated on the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

\* These Pans may be seen in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves.

## SPECIAL NOTICE.

We wish it distinctly understood that all the interest which Julius Silversmith ever had in the MINING AND SCIENTIFIC PRESS, ceased in November of 1862. EWER & SMITH are now the publishers and proprietors.

## FROM THE AMADOR COPPER MINES.

JACKSON, MAY 25, 1863.

MR. EDITOR:—I send herewith a box of specimens from the Oriental Company's Claim on the Oriental Copper Lode. No. 1 is taken from the most prominent croppings, in the middle of the claim. Here the walls stand apart 20 feet, and between them is what old copper miners call a "bloom," indicating an immense mine. The walls and the gossan between them, are well defined through one thousand feet of the claim, in a straight line. No. 2, is from one of the boulders of ore that were found on the vein above the surface. No such ore is found in any part of the vein except near the surface.

The gangue has all the varieties common to well defined lodes, three specimens of which I send you. The malachite occurs near the surface. Then comes the "horn ore" and red oxide, rich in copper, occurs, as the casing of the vein, and at the depth of 25 feet, give place to the black oxides, containing copper and silver, with traces of gold. This casing hugs the head wall, and is but a few inches thick. Next to this occurs a solid vein of black oxide and yellow and gray sulphates of copper, varying from one foot to five in thickness. The "live mudic" then occurs filling the balance of the lode to the foot wall.

We have, as yet, only fairly commenced to open this mine. As we proceed I will keep you posted as to all new developments. The shaft we are now putting down is by no means on the best part of the mine, and the most interesting developments are yet to be made.

The lodes in this district run North, 15° West, and South 15° East, and the underlie, or dip is to the East from 10 to 20 degrees.

THE COSSUNNES CO., whose mine is near and West of the Oriental have out, and ready for shipment from Five to Seven Hundred Tons of excellent ore. These two and the Newton mine are the only ones in Amador county which are taking out ore in large quantities; but several others are being opened with splendid prospects. Thousands of dollars are changing hands, daily, in this County, on Copper "feet," but the mines that are opened the best, and which are rich beyond a doubt, are not in the market. You will please take notice, down at the Bay, that little Amador is an immensely rich County. More anon.

Yours Truly, I. B. FISH.

A GRAND UNION PROMENADE CONCERT will be given by the Temperance Societies of San Francisco, in aid of Mr. H. T. SLIFER, on Thursday Evening, June 11, 1863, at Platt's Hall. Ticket, (admitting Gentleman and Lady,) One Dollar.

## THE DEL NORTE COPPER MINES.

We learn from a gentleman recently from the Del Norte Copper Region, that heavy shipments of ore may soon be expected from that quarter. The lack of road communication between the mines and the seaboard has hitherto been a great hindrance to the working of the mines of that region, as energetically as their developments warrant. This inconvenience has now however been in a great measure overcome and the miners have already commenced work in earnest. The Alta Company have about 400 tons now ready for moving, and their mine is so opened that they can easily raise fully 2000 tons additional before the raining season sets in. The Evoca Company are also raising good shipping ore and have several tons already upon the surface. New developments and important discoveries are constantly being made and the excitement consequent thereupon is drawing off day laborers to an extent which if continued will render it impossible for the old companies to procure the necessary labor to continue their regular working.

We have the promise of full and regular correspondence, which will keep our readers posted with regard to mining progress in that district.

We would take occasion to mention, in this connection, that persons interested in the mines of this region, or desirous to become acquainted with their locations, will find a very full and accurate lithograph map of this country, giving the location of the principal mines, roads, etc., at Bancroft's, on Montgomery Street. This map has been carefully prepared by Mr. R. B. Randall, County Surveyor of Del Norte, and will be found very full and correct.

## THE HUMBOLDT SALT MINE.

The Salt Mine of the Humboldt District has been carefully surveyed, and fully taken up and recorded. The entire survey embraces 17,000 acres. The salt deposit covers an area of 11,000 acres; the balance of 6,000 acres included in the survey, consists of salt marsh of the strongest brine. This marsh has been included in the survey for the purpose of preventing outsiders from coming in and manufacturing salt from this brine, and thus interfering with the monopoly which the holders of the deposit hope to maintain. Under a monopoly of the kind foreshadowed, this deposit must become very valuable, as it lays directly on the probable track of the Pacific Railroad, and immense quantities will soon be required for the treatment of silver ores, in addition to that needed for domestic purposes. We presume the entire location will eventually be consolidated into one Company.

The valley in which this remarkable deposit is found is supposed to be about 500 feet below the bed of the Humboldt River, and is a region of the most intense heat in the summer season. The depth to which the salt reaches is unknown. On sinking into it, water or rather brine commences percolating into the shaft or excavation at the depth of five or six feet, and an opening thus made will, in a few hours fill quite up to the surface of the deposit. This wa-

ter will, by crystallization, soon become a solid mass of the purest and whitest salt. The depth of the deposit has not been ascertained, and probably never will be known. The quality of the salt has been found, by careful analysis, to be very superior, fully equal to the best Liverpool. A wagon road is now in process of construction to connect the Salt Mines with Reese River.

## GOLD MINING IN WALES, ENGLAND.

We have received a communication from our former fellow citizen, J. MOSHEIMER, Esq., now operating among the mines of Dalgelly, in North Wales. Mr. M. writes, in substance, as follows, with regard to those newly developed gold fields:

"If I should tell you that there are, in reality, good gold mines in Wales, you would place just as much confidence in the statement as the people of California did in the first reports of the discovery of silver mines in Washoe. So it is here. People in London, not only the common people, but scientific men also, will not believe what they can learn, by the evidence of their own senses, in a journey of 12 hours. They are so prejudiced in the matter that they pronounce it all a humbug that paying gold mines exist within a few hours ride of London. Yet it is a fact 448 lbs of gold has recently been taken from a single mine in Wales. When I first talked of visiting these mines, people in London said to me, 'don't go down there, it is not worth your while; there is no gold mine there that will pay.'"

I nevertheless went, and have since put up machinery, worked some of the ore, and obtained about one ounce per ton, and I am now putting up six Reduction Works for different Companies."

Mr. M. writes that in addition to the *unbelief* which so generally exists, with regard to the reality of the gold mines, there is also a great lack of *knowledge* with regard to mining for gold. Much prejudice also exists in relation to the introduction of any foreign appliance for the saving of gold, or the reduction of its ores, and our correspondent thinks if the mines are generally found to pay it will not be in consequence of the skill displayed in working them, but because the mines are rich and labor cheap. He also writes that the loss in working is enormous, and that if any person ventures to suggest any new appliance he will not be listened to a moment. Mr. M. is thoroughly conversant with regard to late improvements in working ores both in California and Germany, either of which countries he considers for an ad of Wales in the particular speciality of gold mining.

We should be pleased to hear often from our correspondent, but would suggest that he should endeavor to be as liberal as possible in regard to pre-existing modes and ideas of working. California as well as England, and indeed every other country, is usually extremely sensitive about casting aside established ideas and modes of mechanical operation for that which is new or, to them, untried. Mr. M. however, is taking the right method to convert his unbelieving neighbors by putting his new machinery to actual test. Men will seldom refuse to acknowledge the evidence of their senses, especially when it bears directly upon their pockets.

## WATER PRESSURE AS A MOTIVE POWER.

Among the many problems that science offers her votaries for solution, none perhaps have attracted more attention than the attainment of the most economical and safest application of power to machinery. The application of steam and the introduction of coal have wrought greater changes in the world, during the past century, than all other human appliances combined, from the days of Archimedes to the present era. The great mechanical study of the present time is the possibility of superceding steam. Air, electricity and water or hydraulic pressure, are the means sought to be employed in accomplishing this object. Ericksen has already made himself famous by his efforts in one direction, and something approximating to practicability has been accomplished in bringing into subjection the subtle though tremendous power of electricity. Many inventors are also in the field searching for some mechanical contrivance by which to render available, for motive purposes, the powerful force exhibited in the ordinary Hydraulic Press. Motion, to a limited extent, and in a rectilinear direction, is easily communicated to a column of water; but the difficulties in the way of its practical application for driving machinery, must appear to all conversant with ordinary hydraulic operations, as very great. Still, various mechanical contrivances have, from time to time, been devised which to a great extent, have overcome these difficulties. The first machine of this kind, of which we have seen any notice, was erected in England in 1765. Improvements have been made from time to time, by other inventors. These machines were at first constructed for pumping, at the mines and like the early steam engines used for such purposes, the upward movement of the piston was produced by a weighty leverage. Cylinders are now, however, constructed, much after the manner of the ordinary steam cylinder, and the water is made to drive the piston rod in both directions. An engine is now at work in the Alport mines, Derbyshire, England, with a cylinder 50 inches diameter with 10 foot stroke, estimated at 108 horse power. Another engine of somewhat different construction, but by the same make, is in operation at the Minera Mines in North Wales, with a 35-inch cylinder, 10-foot stroke, pressure column of water 227 feet high, pressure on the piston 98 lbs. per square inch, in a total weight of 40 tons on the piston. This machine is said to work very satisfactorily, requiring no personal attendance. The motion is certain and continuous so long as the working parts remain in order; consequently the cost of maintaining it is of the most trifling amount.

A late English paper gives a description of still another machine of this sort, recently invented by Mr. Henry J. Lewis, an Engineer connected with the water works establishment of Wolverhampton, Eng. This machine is now doing the actual work of a large steam engine, in the most satisfactory manner. Its mechanism in appearance is much the same as that of the steam-engine, with the exception that it has two globes or air vessels upon the cylinder. The action is very simple. The water is supplied to the engine from the main by means of an ordinary pipe, and can be turned on or off by means of a common stop-cock at pleasure. When the engine is about to be set to work, the water is allowed to pass into a chest or nozzle, within which is a slide-valve, the same as is used in a steam-engine. The water, having filled the nozzle, rushes through the passage that is not covered by the slide-valve into the cylinder, forcing the piston along with it, at the same time compressing the air in one of the globes or air-vessels until the slide-valve shuts the passage; when the air that is now compressed in the one globe, by giving a certain amount of elasticity to the water acting on the piston, enables the crank to continue its motion. After the valve has covered the one passage, preparatory to opening the other passage for the return stroke of the engine, the same process is repeated. The rectilinear motion is converted into a rotary motion by means of a connecting rod and crank, and applied to the purpose for which it is required by ordinary pulley bands.

The advantages which would attend the successful introduction of water pressure engines must be very great. Such machines could be used wherever it is convenient to take water from a main service pipe, in cities or elsewhere, or wherever a small supply of running water can be obtained at a great elevation—an incline of any extent being equally as available as a perpendicular fall. No boiler or boiler fix-

ings or cumbersome water-wheel would be needed. There would of course be perfect freedom from danger by explosion. It would require no supervision beyond the mere turning of a stop-cock to start or stop it. It may be worked at long or short intervals and no time need be lost in "firing up." The construction according to the above description is very simple and would in consequence be of slight cost, while the charge for water would be much less, even when purchased as in cities, than the expense incurred for coal and attendance upon a steam engine.

An engine possessing such advantages would be of incalculable value in California where its applicability would be so extensive for the various purposes of pumping, lifting, milling, &c.

## HUMBOLDT CORRESPONDENCE.

UNIONVILLE, N. T. MAY 21, 1863.

EDITOR MINING AND SCIENTIFIC PRESS.—In my last letter I confined myself principally to Buena Vista District. I shall endeavor now to put your readers upon some of the other districts although I am not so well posted myself as I might wish to be. I will commence with Star which has the Sheba, Mammoth, Franklin, Yankee, Jeff. Davis, Daniel Webster and many other very good ledges. The Sheba already has a great reputation in your city, and as nothing that I could write would be likely to increase the confidence of your citizens in the richness of that mine, I will simply say that scientific and practical miners have pronounced it the richest mine in the world. They are at work on the Jeff Davis, Webster, Yankee and American Bason Companies' claims. All of these ledges are supposed to be good and they will all soon be opened in fine style. In Star district also is the San Bernard ledge which is the best defined of any ledge in the Humboldt mines. It crops out from eight to twelve feet wide and about three miles in length. The Enterprise, Eagle and San Bernard Companies are now at work sinking shafts on each of their claims. This ledge runs across the mountain into Humboldt district. The mineral is of a superior quality and pretty well defined through the ledge. In Santa Clara several companies are at work, among them are the Magna Charta, Kentucky, Excelsior and Wyoming. The Wyoming, Union and Tehama companies have recently filed their articles of incorporation. The principal place of business of these companies is Santa Clara with a branch office in San Francisco.

## HUMBOLDT DISTRICT.

In Humboldt District they are at work on the Winne-mucca, Jenny Lind, Melrose, Humboldt and Critenden ledges, most of them taking out paying ore. The Highland ledge, in this district is very rich and well defined and arrangements are now being made to have it opened.

## SIERRA DISTRICT.

In Sierra District considerable work is going on. The Auld Lang Syne company are now hauling rock to Homfray's mill for crushing. The Cressus is also at work with fine prospects. The Douglon, Badger and Annie ledges are looking up.

## ALABAMA DISTRICT.

In Alabama District the Oro Fino Company are running their tunnel as fast as possible; will probably be in within a month.

The Bowling Green and Glenbrook companies filed their articles of incorporation last week—incorporating in this Territory. The former with a capital stock of three hundred thousand and the latter with a capital stock of one hundred and eighty thousand dollars. The Bowling Green ledge is thirty feet wide and rich in silver on top and nothing to do but haul the rock to the mill and have it crushed. In this district is the Solo, Missouri, Golden Fleece and many other rich ledges.

## TABLE MOUNTAIN DISTRICT.

In Table Mountain district the Champion and Silver Cord ledges are taking the lead. They are both very wide and well defined. The shaft on the Champion is down about fifty feet and they are taking out some excellent ore. In Echo district the Washington company are sinking their shaft as fast as possible and taking out some fine specimens of native silver.

In Indian and American districts but little work

is going on, yet there are some very fine ledges there. The Moonlight heading the list of course.

In Buena Vista the work of opening claims is going on briskly. Many companies are being incorporated. Some of them in San Francisco, but most of them in this Territory.

A road has recently been laid out from this place to the Salt Mines, connecting with the Reese River road or at the mouth of Cottonwood Cañon on the Overland Route at Fairview Station, making the distance from this place to Reese River eighty miles.

Near Cotton Cañon is a high range of mountains which bear evident signs of violent volcanic eruptions and, from the indications, a body of burning lava must be near the surface. Not a particle of vegetation can be seen, and upon removing the crust or surface for a depth of four or five inches the heat is quite intense. Near the mountain brimstone is found in considerable quantities, also fine specimens of native copper.

## EXTENT OF THE HUMBOLDT MINES, &amp;c.

What is now known as the Humboldt mines is double in extent to what it was six months ago. The East Range is beginning to attract as much notice as any other portion of the mines. Most of the ledges there are large and well defined and as far as prospected they are rich.

Timber is quite plentiful on the East Range, which is no small item in a mining country; but the old Humboldters will still keep on prospecting and extending their prospecting tours to the second and even third ranges East. I hope the immigration from California will be composed of men who are not afraid to exercise their muscle, and that they will be content to develop and work the ledges that the uneasy and roving adventures find for them.

Our country is settling up quite rapidly and I presume from what I can learn by parties recently from California, that the arrivals at the present time are nothing to be compared to what they will be in a few weeks. But let them come there is work and room enough for all that may arrive and if they are not satisfied with the country they will certainly differ with

QUARTZ.

IMPROVEMENTS.—Numerous substantial improvements are constantly being made on all the principal business streets throughout the city. Indeed the prospects of our city and state were never so flattering as at this present time. The astonishing developments of the principal silver mines on the Eastern Slope; the continued, if not increasing yield of the gold mines within our own state, and the now settled conviction, that we are just entering upon a new branch of mining, which is soon destined to fully equal in importance either silver or gold, is inspiring capitalists with a degree of confidence in the permanency and growth of our city, which they never before have felt. This confidence is every where manifesting itself in valuable city improvements, and in the construction of a vast amount of heavy machinery for the still further development of our mines. San Francisco is now making most rapid advancement in both commercial and mechanical enterprise. With the development of the mines, especially those of copper, commerce and mechanics must go hand in hand, and will continue "marching on," until the Queen City of the Pacific shall occupy a position in the foremost rank of the great cities of the world.

IMPRESSION OF LEAVES.—Take half a sheet of fine paper and cover the surface with sweet oil. Let it stand a minute or two, then rub off the superficial oil and hang the paper in the air; when almost dry, move the paper slowly over the flame of a lamp or candle till it is perfectly black. Lay on it the plant or leaf; place a piece of clean paper over and rub it equally with the fingers for half a minute; then place the plant or leaf on the scrap-book where it is desired to have the impression; cover it with blotting paper, and on repeating the rubbing a representation of the plant will appear, equal to the finest engraving.

NEW SUBWAY IN LONDON.—A new subway for gas and water mains is talked of in London, and ere long every prominent street in that city will be tunneled by a subterranean receptacle for the numerous mains which underlie all the thoroughfares. They would certainly save much annoyance and expence, by avoiding the necessity of so frequently breaking up the streets, as is now indispensable whenever water or gas is introduced into a house.

## RAILROAD FROM MARYSVILLE TO OREGON.

S. G. Elliott, Esq., of Auburn, has recently returned on a preliminary examination for a railroad from Marysville to Oregon. The distance is about 600 miles, and the route is pronounced eminently practicable, and admissible of any grade, with the exception of a section of about 50 miles over the mountains from Klamath to Rogue Rivers. With this exception the road is mostly through level valleys. Money enough has been guaranteed along the proposed line of the road to pay for a preliminary survey, which will be undertaken forthwith. Oregon, Interior and Northern California are rich in iron, coal, copper, lumber, fruit, agricultural productions, wool, etc., all of which would find a market and cheap transportation over the proposed railroad. The people and the "solid men" along the route and all through the interior of Oregon are enthusiastic for the road. Its construction at an early day, will be found not only a convenience but an imperative necessity.

**GOLD ON THE HEAD WATERS OF THE MISSOURI.**—Mr. Burleigh, the Indian Agent, writes to Commissioner Dole, at Washington, that gold in immense quantities has recently been discovered near the head waters of the Missouri, 200 miles west of Fort Benton. The 800 miners who are already there from California and Columbia River, are averaging \$15 and \$20 a day.

**THE NEW ZEALAND GOLD MINES.**—Advices in the latest English papers from Otago, New Zealand, estimate the weekly product of gold at that point at 10,000 to 15,000 ounces, equal to \$10,000,000 a year. New gold fields were being opened in all directions.

**EFFECTS OF IRON PLATING ON VESSELS.**—A communication from Toulon, France, in the *Messenger du Midi*, says: "The laying up of the frigate *La Gloire* in the Castigeanu dock has disclosed three unexpected phenomena. First, that the contact of the copper lining and the submerged iron plates had established a galvanic current, which produced the effect of a voltaic pile, and was completely deteriorating the armor of the frigate in the parts below the water lines; secondly, that a species of shell fish, hitherto unknown, was afterwards discovered among the millions of molluscs by which the hull was covered, apparently produced under the influence of the same galvanic current; and lastly, in the hold of the vessel 22,000 litres of wine were found to be transformed into vinegar, it is not known by what influence."

**THE NEW ORGAN** which has been imported for Music Hall, Boston, is described as a splendid affair. Its cost when finished, will be upwards of \$60,000.

## TO MINERS AND PROSPECTORS.

In view of the frequent accidental discoveries of valuable mineral deposits, other than gold, in almost every section of the State, which have of late been made, it is but reasonable to suppose that prospecting even in California, has but just commenced. The simplest and most universal of all metalliferous deposits is gold. It rarely occurs in any other form than that of "free gold" which is readily discernable to the naked eye. An examination of any rock or earth for gold is an extremely simple process. If its presence is suspected in alluvium, the simple washing of that alluvium in a pan is an invariable test. If in rock of any description; that rock pounded fine in a mortar and washed, in the same manner as alluvium, will usually expose its gold to the naked eye, if there is any there in paying quantity. The only exceptions, are where the gold is contained in iron pyrites, or copper pyrites containing also iron. In either of the two latter cases the presence of gold may be readily ascertained by placing the pyrites in any suitable vessel and keeping the contents at a moderate heat for from four to six hours, with frequent stirrings, by which means the sulphur will be evaporated, and the copper, if any is present, changed to a dull red color, and the gold retaining its natural appearance, on subjecting the whole to the usual panning process, may be readily seen by the naked eye.

Not so with other metals. Silver, copper, zinc, nickel,

and many others appear in such a great variety of metalliferous forms as generally to defy all but the most practical and scientific eye. No description of these ores can be written which will afford any very important aid to the inexperienced in making explorations. After reading descriptions, however, and carefully examining the specimens described, the explorer may go out and search with some degree of confidence and intelligence. A study of the characteristics of the sulphurets alone, would lead an explorer to pass over, entirely unnoticed, the richest varieties of the ores known as Chlorides or Horn Silver, which, from the facility with which they may be worked, and their usual richness, are generally considered the most valuable of silver ores. There is much reason to believe that this variety of silver ore will be extensively found in all the volcanic regions of this State. So with many other ores.

Considering the great difficulty, in the present lack of cabinet collectors, and other means of instruction, to acquire a practical mineralogical and geological education in this State, and desirous to aid, to our fullest capacity, the development of our mineral resources, we hereby make the offer to miners, prospectors and all others, who in their travels or explorations may come across specimens having the appearance of rarity or value, to carefully examine and pronounce upon the same, free of charge, as to their characteristics, value, etc., whenever any such specimens are brought or sent to this office free of cost to us. We have already been called upon in many such cases, and we shall at all times be willing to give our attention to any such requests which may be presented to us.

In carrying out the plan we propose, every miner and prospector should be at all times on the lookout for any new mineral. The ordinary rocks with which the miner meets in his travels and labor, and which possess no mineral value are usually well known. Whenever a rock presents any unusual appearance in conformation, color or other characteristic, attention should at once be given to it. There is scarcely a piece of quartz or rock of a quartzose nature, which presents any uncommon appearance in texture or color that has not been thus modified by the deposit or intrusion of some mineral substance. If such rock is found upon or near a vein of quartz it should be carefully examined "in place," and if the cause of its peculiarity is not evident and readily seen, it should not be passed carelessly by. There may be value in it, although the gold may not shine there. We shall commence in our next issue a series of articles describing as accurately and as intelligibly as possible all the ordinary mineral substances which may be likely to come under the notice of the California prospector. These articles will be published under the head of "THE MINER'S LABORATORY," and will be found of great value to the mining public. [*Mining and Scientific Press*, April 20.]

**SUBSCRIBE.**—Are you a miner and not a subscriber to the *MINING AND SCIENTIFIC PRESS*? If so, you are an annual loser of many times the price of a year's subscription, particularly if you are engaged in quartz mining. The same amount of practical information, important to miners and mechanics, which is contained in a volume of the *Press*, cannot be bought from the shelves of any bookstore in the country for the price of several year's subscription. Do you ever send a paper to the "Old Folks at Home?" If so, and you desire to send important information and valuable reading matter, you can find no paper that will be read with so much eagerness by them, or one that will convey to them so full an account of the real industry of the country as the *MINING AND SCIENTIFIC PRESS*. We invite all to send us their names and *four dollars*, or *two dollars* for six months, and become patrons of the only mining paper printed on the Pacific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examination, and with the hope that it may so far meet with their approval as to warrant their subscribing for it at once. It is not our usual custom to receive a subscriber for less than six months; but inasmuch as we are anxious to introduce the paper where it is not now known, we will, for the present, send the *Press* for three months even, on the receipt of one dollar, in coin or stamps. It is our belief that no one will wish to discontinue the paper after being a constant reader of it for even that short period.

## Mining and Scientific Press.

The *MINING AND SCIENTIFIC PRESS* is published at the Exchange Building, Room 27, corner of Battery and Washington streets San Francisco, Cal., at FIFTY CENTS per month, or \$4 per annum, in advance.

C. W. M. SMITH and W. B. EWER, Proprietors.

## Engravings, Electrotypes, etc.

We execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. SKETCHING and ENGRAVING, Designs of every description—Buildings, Sketches of Towns, Machinery, Stamp Mills, Seals for Plain or Colored Printing. Job Work executed with dispatch at low rates. Patrons will remember that when we execute engravings we will insert them free of charge in the *MINING AND SCIENTIFIC PRESS*, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

## To Printers.

AN INTEREST in one of the most flourishing and best paying Newspaper Offices in the mountains is offered for sale on easy terms. A rare opportunity is hereby presented to any printer desirous of establishing himself in a good business in one of the healthiest, most thriving and delightful mountain towns in the state. For further information enquire at this office.

## MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

THIRD YEAR! VOLUME VI.—NEW SERIES!

A new volume of this extensively circulated paper commenced Sept. 11, 1862. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Art, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

## The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

## The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

## The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

## To Chemists, Architects, Millwrights and Farmers!

This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

## Terms.

To mail subscribers:—Four Dollars per annum.

## Club Rates.

Five Copies for Six Months, \$8.  
Ten Copies for Six Months, \$16.  
Ten Copies for Twelve Months, \$20.  
Fifteen Copies for Twelve Months, \$44.  
Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2.60. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

EWER & SMITH, Publishers,

Room 27, (formerly) U. S. Court Building, Corner of Washington and Battery streets, San Francisco.

## Our Mint, its Rules, Charges and Operations.

## For parting silver from gold when gold

is below 300-1000ths. fine . . . . . 3cts per oz.  
" from 30-100ths. to 750-1000ths fine. 7 cts " " oz.  
" " 750-1000ths to 950-1000ths " 14 cts " "

## DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce  $\frac{1}{2}$  per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300 3cts. per oz. gross weight  
301 " 500, 7cts, " " " "

## DEPOSITS FOR FINE BARS

\$1 16-4-11ths cents. per standard ounce,  $\frac{1}{2}$  per ct. gross value of silver for making bars; also when gold is contained  $\frac{1}{2}$  per ct. on gross value of gold for coining. Refining charges as in purchases.

## BARS SOLD FROM REFINERY.

\$1 21cts. per standard oz.  $\frac{1}{2}$  per ct. gross value to be added for making bars.

## DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz.  $\frac{1}{2}$  per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

## DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz.  $\frac{1}{2}$  per ct. gross value of deposit for making bars.

## THE MINERS' LABORATORY.—NO. V.

## MUNDIC—PYRITES.

One of the most common characteristics upon and near the surface of a vein of copper is the appearance of large quantities of Pyrites—sometimes called Mundic. Whenever this mineral is so found, in great abundance, especially if in a region productive of copper, the miner may have the utmost confidence in prosecuting the work of developing his vein. Pyrites are most usually yellow, varying from nearly the color of gold to an iron white.

Pyrites sometimes contain, mechanically mixed, small quantities of gold. They are then called "auriferous pyrites." The gold mines of California contain large quantities of this description of mineral, and thousands of tons are now being worked for this metal. They are, here, usually concentrated from the sands which have passed through the ordinary gold amalgamating processes. One of the most extensive and perhaps the most thorough establishments for working auriferous pyrites, is that carried on by Mr. Deetkin, a short distance from this city, on the San Bruno road.

Copper pyrites constitute the principal ore of that mineral, and frequently occur very massive, occupying the entire width of a vein, sometimes many feet in thickness, but oftener in strings and bunches comprising but a small percentage of the entire contents of the vein. Copper pyrites is not considered a rich ore. Their yield of copper is usually from 12 to 20 per cent, rarely reaching 25. The richness of this ore may generally be pretty correctly estimated by its color. If of a fine yellow color and readily yielding to the hammer it may be considered a good ore; but if hard and of a pale yellow color it may be set down a poor quality of ore. The color and consequently the value of this ore is attributable to the more or less abundant presence of iron.

## GOSSAN.

We hear much said among copper miners and prospectors for copper, about "gossan," and furthermore that the appearance of gossan is a good indication of copper—and so it is. The question is also often asked, "What is gossan?"

Gossan is nothing more nor less than decomposed mundic, or iron pyrites. It is usually of a yellowish color, sometimes, however, approaching to black or dark red. The general composition of gossans oscillates between the two extreme results as given below:—

	No. 1.	No. 2.
Quartz .....	10	85
Water and Crenate of Ammonia.....	10	3
Oxide of Iron, etc.....	80	12
	100	100

The term, gossan, originated in Cornwall, and for a time was local, but is now quite generally used in this country also. The existence of mundic or its common resultant, gossan, is not universal. In some rich mining districts no iron, or very little at most exists in the veins; in such, the ferruginous stain is wanting and gossan is not seen.

In California, we presume, from copper explorations thus far made, and from the general character of all our quartz veins, gossan will be almost universally met with, and wherever it or mundic is found, rich and valuable ores of copper, and possibly of tin may be confidently looked for at depths ranging from 15 to 50 feet beneath. Gossan, of itself, is generally of but little value, although it sometimes contains small quantities of both gold and silver, and not unfrequently copper. It is often found, in small quantities, far down on the vein.

Beneath the gossan, we frequently observe appearances strongly reminding us of the common electrotype process for procuring copper from a solution of sulphate of copper. The pure metal is gathered together in chinks and cavities between the main mass of gossan and the body of the undecomposed copper pyrites, mingling perhaps with the lower part of the former. Sometimes this native copper, as it is called, may retain its metallic character; but at others it becomes converted into an oxide, and this again into a carbonate, by the percolation of waters containing common air and carbonic acid.

With regard to the formation of this native copper it is probable that the sulphur, by a union with the needful oxygen, becomes sulphuric acid, and that, this formed, the copper is attacked and removed to be dealt with like any other solution of the sulphate of copper.

We can hardly conceive it possible that the copper, in fluid state, has been forced up from below like dikes of porphyry or greenstone. An elastic force sufficient to raise a fluid mass of three times the density of lava would shatter the enclosing walls, and force the copper into the fissures. If this were its origin, we ought to find it occupying the depressions in the surface rocks in the vicinity of the fissures, like modern lava cu rents.

We find the copper investing various crystalized minerals; and every wave and stria of the pre-existing crystals is faithfully represented. It is impossible, by any artificial method, to cast any metal so as to exhibit such minute lines. They are as delicate and faithful as could be obtained by the electrotype. Again, the associated minerals do not exhibit the effects of a high temperature. Also, if the contents of the veins were the result of injection, their productiveness would be unaffected in their passage through different mineral planes. Lastly, copper and silver combine in indefinite proportions, forming a homogeneous compound; and yet we find them existing side by side almost chemically pure. Admitting that they once formed a homogeneous compound, it is reasonable to suppose that they have been separated by electro-chemical agency.

We shall speak more fully of this supposed electrical action in copper and other mineral veins, in a future number.

[We have received, from a thorough and practical mineralogist, a communication, containing much valuable information, in addition to what we have already given, explanatory of the various methods by which the presence of copper in any mineral or other matrix may be readily ascertained by the prospector; also a list of the chemicals and other apparatus requisite for such tests. We shall insert the communication, next week, under our Laboratory head.]

## PRACTICAL MEN WANTED.

The Mechanics of San Francisco have inaugurated a movement which ought to command the attention of all thinking men throughout the State, and, indeed, throughout all the States. At a meeting of the mechanics, held in this city, on Thursday Evening last, it was resolved that the exigencies of the times urgently demand that at least one of the three Representatives to be chosen at the coming election should be a person of known practical, mechanical attainments, and one who should be thoroughly posted with regard to the mechanical interests and wants of the State and country.

We most cordially endorse the sentiments and importance attached to the purpose of the meeting above referred to. The Resolutions have been widely circulated by the press of the city, and their substance will be known to all of our readers before this sheet reaches them. The movement should not be confined to San Francisco, but should be made general throughout the State.

We would beg leave to add one amendment to the movement, and that is, in addition to the selection of a suitable member to represent the mechanical interest, another should be selected with reference to his peculiar fitness to correctly and intelligently represent the mining interest. Let the Miners and Mechanics of the State join hands, and demand, of the convention which is to assemble on the 17th of June next, that they should put in nomination, two individuals who shall be suitable persons to represent the two great leading industrial interests of the State. If they fail in doing that simple act of justice, let such steps be taken forthwith as shall make the politicians, FEEL that the mechanics and miners of California are a power in the State, having rights and interests at stake, which cannot be overlooked for the sake of mere political gain, or the spoils of office.

CHANGE OF NAME.—What was the *Hesperian* comes to us this week in its old form and with its former Editor, but under a new name. The "*Hesperian*" and "*Pacific Monthly*," appear to have joined hands, and the subscribers to both of those periodicals will hereafter be supplied with the new "*Pacific Monthly*," published in octavo form and under the Editorial Management of J. D. and M. D. STRONG. The Editorial corps is a strong team, and we doubt not will furnish their readers with a Magazine which shall be a fair exponent of the literary status of the Pacific Coast.

## THE PEAVINE MINING DISTRICT.

Considerable attention has recently been attracted to the Peavine Mining District, a locality on the western border of Nevada Territory, and a short distance to the northward of the Henness Pass Route. A late correspondent of the *Bulletin*, of this city, gives some facts with regard to this district which we have condensed as follows:—

The name, "Peavine," had its origin from a solitary vine of that name, which one of its early visitors discovered growing near a spring, and not as generally supposed from an abundance of this nutritious herbage growing in the valley. The most of the ledges now being worked were discovered only some three months since. On a few of these ledges shafts have been sunk from 30 to 50 feet, but on most merely a little "scratching" has been done to hold them.

## COPPER INDICATIONS, &amp;c.

Most of the ledges show croppings of a greenish substance indicating the presence of copper intermixed with coarse grains of gold. This kind of rock generally runs out at a distance of 15 or 20 feet from the surface and is succeeded by quartz varying in colors and firmness as well as in the value of the metal it contains. Other ledges, again, commence with white, blue, black, and yellow quartz, resembling much the character of ore discovered in and around the Virginia City, and in most of which gold is plainly visible to the naked eye, and which, also, upon a proper test, yield richly in silver.

The lodes located in the hill to the right of the town appear in the following order: The Lucky Bill, White Diamond, Magnolia, Bevil Hammer, Green Mountain, Katy Wakeman, Offield, Carondelet and Virginia ledges. Leaving these and passing over the hill to the westward you reach the Lone Star, Mountain Sheep, Dix, Black Hawk, Irish American and Mammoth—a well defined ledges. To the left, and a mile or more distant, you discover the Young America, Star of the West, Kitty Clyde, White Sugar, Summit, Monitor, and Yuba ledges. The last three named have been but lately discovered, and from present appearances bid fair to excel them all. Some of the rock recently taken out is not only rich in gold and silver, but shows masses of copper almost in its pure state. I am confident that a ton of this rock now outside of the mine will yield from \$1,000 to \$2,000 in gold, and I think the copper left will yield from 40 to 60 per cent; and an assay lately made shows silver to the amount of \$90 to the ton. Other claims have been carefully tested, both in assays and the old fashioned method of pounding up and panning out, and although they do not equal the claim spoken of above, yet they show sufficient "indications" to warrant the belief that they prove rich. The Lone Star and Young America stand foremost in the list; and in fact there is none where the ledges are fairly struck that do not show good prospects. But in order to work these mines successfully, it requires not only patient labor and considerable outlay of money, but what is still more requisite, suitable mills and experienced workmen. That mills can be run here at a small cost is evident from the abundance of wood and water near at hand.

A few days travel by way of Downville will bring mining capitalists direct to these mines. The greater part of the travel and transportation from California to the Humboldt river will pass this way by the new road now being built and to be pushed to completion during the present summer.

An important improvement in naval architecture has been satisfactorily tested this week. The steamer Kate has been tried at the Nore with a double screw—an arrangement which enables her to steer herself rapidly and easily without any use of the rudder, and to turn with the greatest facility where ordinary steamers find the operation one of much difficulty. Should the rudder be shot away, the screws, which are not at all exposed to the enemy's shot, would still give complete steering power. [London Spectator, March 7th.]

GLUE FOR READY USE.—To any quantity of glue use whiskey, instead of water. Put both together in a bottle, cork it tight set away for three days, when it will be fit for use without the application of heat. Glue thus prepared will keep for years, and is at all times fit for use except in cold weather, when it should be set in hot water.

## DESKS

AND

Office Furniture,

OF ALL KINDS.....FOR SALE BY

**JOHN WIGMORE,**

No. 423 CALIFORNIA ST., SAN FRANCISCO.

OFFICE FURNISHING, of all kinds, attended to.

**PALMER, HANSCOM & CO.,**

**GOLDEN STATE IRON WORKS,**

No. 19, First Street, San Francisco,

urnish Castings and Machinery of all kinds

ALSO:

GENUINE WHITE IRON SHOES AND DIES.

PALMER, HANSCOMB & CO.

**To Quartz Miners.**

**Knox's Improved**

**AMALGAMATING PAN,**

WITH

**PALMER'S PATENT STEAM CHEST.**

THE ABOVE COMBINATION SECURES THE MOST complete amalgamation of the precious metals of any process now known.

By its steam is introduced in the most effective and economical manner, while it is peculiarly adapted to the melting of floating gold and silver, known to be other gold. Made exclusively by

**PALMER, HANSCOM & CO.,**

**GOLDEN STATE IRON WORKS,**

No. 19 & 21 First Street, San Francisco

The public are informed that Letters Patent have been granted the undersigned upon Steam Chest False Bottoms for the inside of Amalgamating Pans or Tubs, and are cautioned against making, buying, using or selling the same without his consent. W. A. PALMER.

## DEETKEN'S

**Chemical and Metallurgical Works,**

On San Bruno Road, Islais Creek, SAN FRANCISCO.

**SOLD BEARING SULPHURETS WORKED AT REASONABLE RATES. ALL THE GOLD EXTRACTED BY Chemical process. Yield of Sulphurets from 30 to 50 per cent more than the BEST AMALGAMATION PROCESS.**

**Apparatus for separating Sulphurets set up by experienced hands at a cost of \$50 to \$100, if desired by owners. No power nor clean water required for purpose.** nov8-3m

**LEWIS COFFEY AND RISDON,**

**STEAM BOILER AND SHEET IRON WORKS.**

The only exclusively Boiler Making Establishment on the Pacific Coast Owned and conducted by Practical Boiler Makers. All orders for New Work, the repairing Old Work, executed as ordered, and warranted as quality.

Stand, corner Bush and Market Streets. Opposite Oriental Hotel, San Francisco, Cal.

LEWIS COFFEY, J. N. RISDON.

**JAMES PHELAN,**

(Late J. & M. PHELAN.)

**IMPORTER AND JOBBER,**

**Wines, Liquors, Etc., Etc.,**

No. 616 & 618 Front street, Between Jackson and Pacific Streets, SAN FRANCISCO. Established 1849.

All Goods Guaranteed. Orders Solicited. TERMS LIBERAL. Jan. 1-11.

**THEODOR KALLENBERG**

**Maker of Models**

**FOR INVENTORS.**

MACHINES, MATHEMATICAL, Optical and Philosophical Instruments, Scales, Weights, etc.; Steel Maps, Dies and Die Sinking, Embossing Stamps. Repairing of Machinery promptly attended to. No. 4 Sansome street, corner Market, San Francisco.

## Volcanic Smelting Furnace.

PERSONS DESIRING INFORMATION AS TO THE USE and economical properties of this Furnace, and intending to make use of the same, when satisfied of its superiority over all other means of reducing ores and separating metals from the sulphurets, can obtain all needed explanation and a plan in regard to the same, and the terms of sale of rights to use the same, on application to Col. J. D. Stevenson, or T. O'Gee Shaw, or by letter to the proprietors through the Post Office of San Francisco. Drawings may be seen at the office of Col. J. D. Stevenson, No. 614 Merchant street, or at the office of T. O'Gee Shaw, N. Brannan's Building, Montgomery street.

The time required for reducing ores by this Furnace is from three to eight hours, and the amount of fuel only one-tenth as much as is consumed by other processes.

The process of condensation is applied to this Furnace which will save all those portions of precious metals which usually escape in a volatile form.

The attention of all interested in the subject is requested to examine the important results obtained by this process.

Parties wishing will be allowed to erect a trial Furnace of capacity for smelting one ton of ore or more, on signing an obligation to pay the usual fee for the right to use it, should they continue to make use of the invention or a longer period than two months. nich 16 MIS' E. J. HALL, M. D., Proprietors.

## New Style of Lady's Buckle.

**W. BOHM, INVENTOR & PATENTEE**

THE SUBSCRIBER HAVING OBTAINED LETTERS PATENT from Washington for an improvement in the construction of Ladies' Buckles, is now ready to furnish the same in every variety of style. This buckle possesses several very important improvements over any other in use.

The invention having been carefully examined at the Patent Office, has been adjudged to be a useful improvement, and Letters Patent have been granted for 17 years. It excels all other buckles in

**Usefulness, Strength and Appearance.**

The Public is respectfully invited to call and examine this Buckle at the Jewelry Establishment of

**BRAVERMAN & LEVY,**

621 Washington Street, San Francisco.

**JOSEPH, BROTHERS,**

607 Montgomery Street, San Francisco.

**FLOBERG & CONRAH,**

118 F Street, Sacramento.

Agents for the Patentee.

Every Buckle sold will be guaranteed as to its Strength and Durability. W. BOHM, Patentee.

**LEANDER RANSOM,**

**Civil Engineer**

AND

**SURVEYOR,**

Having been connected with the public works of the State of Ohio for 20 years, and the public surveys of the State of California for 7 years.

ALSO

**STATE LOCATING AGENT.**

And as such having the sale of

**600,000 ACRES OF STATE SCHOOL LANDS,**

**At the low price of \$1.25 per Acre.**

Terms—Twenty per cent in cash and the balance on a credit of several years.

OFFICE: Second floor of Express Building, N. E. corner of Montgomery and California streets. oct7-3m

**HAYNES & LAWTON,**

IMPORTERS AND DEALERS IN

## To Mine Owners.

**PARTIES having a Good silver Mine**

and wishing for

Machinery to work it for an interest in the Mine

Will do well to apply at this office. No organized company need apply.

## 50 lbs. MARINE and

**Fire-Proof Paint,**

**MANUFACTURED BY THE PACIFIC METALLURGICAL** Works in this city, for Hulls and Decks of Vessels, from ground Mineral Rock contains Arsenic, Copper, Litharge and six other Minerals. When used on the Decks or Bottoms of Ships, it is equal to a coat of Stone, and quite equal to Copper, no Worms will ever effect it, and cheaper than any other paint.

**DIRECTIONS:**

For Decks of Ships, use two parts Mineral Paint, one part White Lead, mix with Linseed Oil.

For Bottoms of Vessels, use one part ground sulphur three parts Mineral Paint, mix with Coal Tar and apply it hot.

For sale by all Ship Chandelers and Tradesmen, in boxes of 50 lbs. each, or by the Pacific Metallurgical Works.

**25 POUNDS FIRE-PROOF PAINT.**

When used on Roofs, Buildings, or Fences, it is equal to covering them with a coat of Stone, being perfectly Fire Proof, and costing less than any paint.

**DIRECTIONS:**

HOUSE:—Mix three parts Mineral Paint with one part white lead, thin with Linseed oil: if a lighter color is wanted, mix less paint, more lead.

ROOF:—Five parts of Mineral Paint, one part white Lead; mix with Linseed oil. Put it thick on a tin Roof as one coat when properly applied will last three years.

S. C. BRADSHAW, Agt.,

G. T. FOUQUE, Superintendent.

**WORKS, North Beach; Office, 318 California st., San Francisco.**

## WRIGHT'S PICKS.

**JOHN WRIGHT,** of Sacramento, has established himself in San Francisco for the manufacture of every description of PICKS, of the best material, at reduced prices. PICK EYES of the best iron furnished in any quantity, at low rates. Orders from the country promptly attended to. N. B.—None genuine unless stamped with my name.

JOHN WRIGHT, 611 Market street, Opposite Battery, San Francisco.

## REMOVAL.

**OFFICE OF THE PACIFIC METAL.** Largest Office is removed to 318 California street. Having enlarged our Works at North Beach, we are now enabled to reduce from 10 to 35 tons of Silver, or Gold rock per day.

Gold and Silver ore, and Sulphuret Assayers', or Silversmiths' sweepings reduced or purchased.

**COPPER ORES**—Highest market rates advanced in cash, for shipments. S. C. BRADSHAW, Agent,

318 California street, near Sanson.

**Amalgamating and Separating Pans.**

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of trituration, and in cleaning up. By the introduction of the Separating Pan to follow the trituration this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

\* \* \* These Pans can be seen in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves.

**MACHINE WORKS**

**First St., between Howard & Folsom**

SAN FRANCISCO.

**EVERY DESCRIPTION OF IRON AND BRASS** Machinery, the Best and Most Economical, manufactured in the state of California, will be furnished with patch at the Miners' Foundry and Machine Works, at

Steam Engines and Boilers, Flower, Saw and Quill machinery, Mining Pumps, Amalgamators, Re-tainers and Water Wheels—some in operation and on exhibition.

Particular attention will be given to the manufacture of Machinery in Sections, designed for places of difficult access. Various models of Quartz Crushers, Amalgamators and Water Wheels—some in operation and on exhibition. \* \* \* Parties desiring to test their ores practically in small quantities will be afforded ample facilities, free of cost.

All parties desiring accurate and highly finished drawings and Superior Machinery, at most reasonable rates are cordially invited to call before contracting elsewhere.

**HOWLAND, ANGEL & KIN**

San Francisco, February 23, 1863.

W. B. EVER,  
EDITOR.

A JOURNAL OF MINING, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

EWER & SMITH,  
PROPRIETORS.

VOL. VI.

SAN FRANCISCO, MONDAY EVENING, JUNE 8, 1863.

NO. 32.

#### SPECIAL NOTICE.

We wish it distinctly understood that all the interest which Julius Silversmith ever had in the MINING AND SCIENTIFIC PRESS, ceased in November of 1862. EWER & SMITH are now the publishers and proprietors.

#### POST-OFFICE COMPLAINTS.

We hear frequent complaints from subscribers in various quarters, with regard to the non reception of papers, and have found it impossible, in several places to extend our circulation, for the only reason that the "PRESS" can not be obtained regularly from the Post-Office. We know not where the fault is. The paper is regularly mailed at the San Francisco Office, done up in strong wrappers, and carefully rected. Subscribers who fail to receive their papers regularly should first learn from their local Office, whether, when the papers do arrive, they come in good order, or whether the wrappers have been removed, etc., and communicate the facts to us. We will then endeavor to learn the cause of the irregularity, and so far as possible rectify the same.

**TREASURE SHIPMENT.**—The shipment of Treasure by the St. Louis of the 3d inst. was as follows:—

To England.....	\$766,214 43
To New York.....	184,484 21
To Panama.....	5,000 00
Previously this year.....	\$955,698 64
	20,451,139 15

Total since January 1, 1863.....	\$21,406,837 79
Corresponding period of 1862.....	14,596,066 05

Excess this year..... \$5,810,771 74  
The large and constantly increasing gain upon the treasure shipments of the last and several previous years, is a most important and note worthy fact. This excess must be set down exclusively to the credit of Washoe, and will, in all probability, reach by the end of the year nearly or quite an excess of \$15,000,000 over the shipments of 1862. The produce of California, in all probability, has fallen off the present season, in consequence of the immense draft upon the population by the mines of the Eastern Slope, and by the working and prospecting of the newly developed Copper mines in our own territory, the produce of which will make no show in our treasure shipments, but go exclusively to swell the total of our general exports. We may look for an important increase in that direction, when we come to close up the product of 1863.

**TO COPPER MINERS.**—We would call the especial attention of those engaged in raising copper ore to the advertisement, in another column, of the "Pacific Mineral Company." This is a new agency recently established in this city, for the purchase of copper ores. The Company's Office is at Room No. 1, Odd Fellows' Hall, Montgomery St.

**THE GREAT CHESS PLAYER BEATEN.**—Paul Morphy has again been beaten by Mons. de Riviere in a friendly match at chess—the latter winning three out of five games.

#### Another New Amalgamator.

The spirit of invention is still active among our mechanics, and mining improvements come in for their full share of attention. During the past week not less than four apparently important inventions, in this direction, have come under our notice, as Patent Solicitors. Of course we can say nothing about them at present. At some future time the attention of the public will be called to their importance.

Two weeks since we made allusion to a new Amalgamator recently invented by Mr. HOWLAND, of the Miners' Foundry in this city. This machine consists of a hollow, stationary, iron drum, with a fan-wheel, having each arm or fan perforated with numerous holes, revolving within the drum at about 350 revolutions a minute. The pulp, or ore, after being first quite finely pulverised, is put into the machine through an opening at the top of the drum, and is then beaten and battered about, and forced through the little holes in the pan, until it is further reduced to an impalpable powder, and thoroughly amalgamated the while. The "process" employed is a combination of the Frieberg, Patio, and several others, and is in short and in fact an improvement in both the manner and speed of the Frieberg barrel process. Quite a number of practical silver ore workers have examined the machine, seen its workings—at the Foundry—and all, we believe, express faith in its success. A small machine may be seen in operation at the above mentioned Foundry, where they are also constructing one of large dimensions, suitable for the heaviest milling operations.

#### More Machinery for Mexico.

The Sunny South is now taking on board a set of machinery for the El Pecacho (The Peak) Gold and Silver Mining Company, located in the San Antonio Mining District, Lower California, and about 20 miles back from Ventana Bay. The proprietors of this mine are all citizens of Nevada County, where they have filed their papers of incorporation. E. H. Gaylord, of Nevada, is Secretary of the Company, and W. W. Cozzens, President. Charley Barker, one of the pioneers of that County, and an estimable gentleman, withal, is the general Agent of the Company. The machinery has been constructed in this city, under his direction; Palmer, Hanscom & Co., of the Golden State Foundry, being the Contractors. The wood work of the Battery, which, for the present, is but a small one has been constructed at the shop of Mr. E. O. Hunt, on Jessie St., and is a very substantial piece of work. The locality of the Company's Mine is one of the richest in Lower California, and we shall be most happy to chronicle their complete success.

**COPPER CONCENTRATING MACHINERY.**—A splendid, new 40-horse power Engine, from Donahue's Foundry, will be shipped, to-day or to-morrow, designed to drive the Concentrating Works now in process of erection on the Keystone Copper Mine—the western extension of the Union. A large number of mechanics are now engaged in getting up the machinery at the mine.

We notice a statement in a paper published in this city, to the effect that a gentleman at Mokelumne Hill has invent-

ed a machine for concentrating the ores of copper, which we understand, is operated upon the principle of the common gold sluice. Such machinery will be found impracticable when applied to copper. The specific gravity of copper is so much less than that of gold, that a principle which will work most advantageously in the latter metal, will be found entirely useless when applied to the former. The business of concentrating copper ores, though simple in its process, is one of the most difficult of the arts of mining to carry into actual practice, and requires infinitely more skill and attention than the usual processes for separating gold from its sands.

#### A New Work—Important to all Mining Companies.

Wm. A. Andrews & Co., a new firm in New York, who propose to open a Pacific Mining Agency in that city, are preparing a work to be issued about the last of July, embracing a synoptical statement of all Mining Co's in this State and the adjoining Territories. It will be published in pamphlet form, and 50,000 copies distributed, gratis, in the Eastern States, with the intention of bringing Pacific Mining Stocks more particularly to notice in the East, for investment and information of the mass of the people, outside of the leading capitalists of New York and Eastern cities. Such companies as are prominent before the public, and those whose prospects are deemed worthy, will be embraced in the 1st Volume. A 2nd Volume will be issued to include all new companies formed subsequent to the compilation of the 1st. An opportunity will be offered to advertisers, for a few outside pages in the work. MR. LEON HARNETT is Advertising Agent, and Mr. J. A. Woodson, San Francisco Corresponding Agent, of whom further information can be had.

All Companies upon whom the Agents have not called, will please address us as above, and answer, as full as may be, the following questions:—

1. Name of Company.
2. When discovered.
3. Where located.
4. When incorporated, and where.
5. Extent of Claim.
6. Capital Stock.
7. No. of Shares.
8. Assay per ton: Gold, Silver, and Copper.
9. President and Secretary, Board of Trust's.
10. Location of Office.
11. Such additional information as may not be

embraced in answers to the foregoing interrogatories.

Note.—Specimens of Ore requested, labeled, for reference in Cabinet of New York Office.

W. A. ANDREWS & Co.,  
Pacific Mining Stock Agents, New York.

**TO COPPER ORE SELLERS.**—Martin & Co, at their Office, 224 Montgomery St., are prepared to contract for the purchase of copper ores, assaying from eight per cent. and upward to the ton. They will make advances, etc., when desired. See their Advertisement.

**IMPORTANT SILVER DISCOVERIES** are reported to have recently been made on the West bank of Lake Bigler. A town site has been laid off, mill privileges taken up, etc.

## OUR MECHANICAL INDUSTRY.

San Francisco is destined to become the Workshop, as well as the Commercial Centre of the Pacific Coast. In addition to the seven or eight Foundries now in operation in this city, all of which are conducted by wealthy capitalists and experienced mechanics, we also find, scattered here and there, numerous Machine Shops of less pretensions dimensions, but where employees and managers are equally as well skilled, as any in the city; and many of whom, no doubt, in the future growth of our metropolis, are destined to enlarge their field of operations until, by gradual advances, they reach the point of first class establishments. Among the several establishments of this class which have already found a place in our note book, for special notice, is that of

E. T. STEEN'S MACHINE SHOP,

No. 33, Fremont Street. Mr. S. is at the present time engaged in the manufacture and sale of several new and useful articles of machinery, which are fast finding favor among those engaged in general mechanical operations.

One of the most useful of these articles is "Reynolds' Patent Cut-off and Governor for Steam Engines." Among all the various contrivances for reserving power in the application of steam, by regulating the quantity used to the exact necessity of the moment, that above named appears to be the most perfect, prompt and reliable. To saw mills, printing presses and, indeed, all machinery where the work to be accomplished is very irregular in its requirement of power, one of these machines will effect a saving of from 20 to 60 per cent. of fuel. A large number of these machines are now in use in California and Nevada Territory.

MR. STEEN has himself invented a machine of this description, which he also manufactures and has for sale. His modesty does not allow him to say much of his own invention, but it will speak for itself and may be seen at the Golden State Foundry and at the Stone Breaker, at the foot of Market St.

Another very useful economiser of fuel and power in the use of steam is "Clark's Steam and Fire Regulator, which regulates the draft or blast of the furnace by the pressure of steam in the boiler. This is quite a novel as well as useful invention, as will be readily seen on examination of the machine in use, or by a little reflection upon what such a machine properly constructed, might accomplish.

MR. STEEN also manufactures "Ingersol's Patent Drill Braces." If any person is desirous to learn the value of this recent invention let him go through the Machine Shops on First St., or merely notice the work going on in the street and on the sidewalk in front of most of those establishments. Notice a workman yonder, with one of the old fashioned racket-drills, with the slow clatching motion confined to one direction, and every second motion entirely lost to gain leverage. Now go on a little further and see that man with one of Ingersol's Patent Drills. The motion of the handle is not confined to any particular direction, and every movement, in whatever direction it is made, turns the drill and eats into the iron. To us, the use of this new instrument appears equal to a saving of from one quarter to one half in time—an important point in an economical view, at California prices of labor.

MR. STEEN has also introduced into this State, an invention of especial importance to persons using steam in most localities here. There are few places in California where pure water can be obtained for making steam. The numerous mineral substances contained in the waters of this State, cause much annoyance by their tendency to produce scale in boilers. "Blowing off" at frequent intervals, in many cases fails to keep the boilers in good condition. MR. STEEN is selling an "Anti Incrustation Powder," which is said to be a sure remedy against this annoyance. This powder has been in use at the East for eight years, and is being very generally introduced there, and working its way into use in this State. Reference, as to its utility, is made to the Sugar Refinery in this city, and to L. A. Booth & Co. at Virginia City, also to others.

We have made this extended notice not so much for a puff for MR. STEEN, as to call the attention of our machinists and mill men to the valuable improvements to which reference has been made. MR. S. properly appreciates the advantages of advertising, and displays excellent judgment in

—ecting his medium. Our rambles among the workshops of the city, however, will not be confined exclusively to those who may, for the time being, see fit, or think it for their interest to extend patronage to us. All alike will be visited and noticed in turn; and while we would not importune any one for their patronage, we shall ever be happy to receive and acknowledge favors from all. We hope, as time progresses, to be able to make the PRESS more and more useful to our mechanical as well as mining interest.

## NOTES OF A TRIP TO SLATE RANGE VIA LOS ANGELES AND EL-PASO. NO. 2.

THURSDAY, APRIL 9TH. Left Mayhew's about 10 A. M. and traveled over a portion of the immense plain lying between Los Angeles and the Ocean.

The land is not all level, though it looks so at a distance. We found some valleys from fifty to one hundred feet in depth, gradually descending and rising, but no water, no feed for the immense number of horses and cattle, wandering over it. In the bottom of one valley we found a dry river bed which had been cut out by the great rains of '61 and '62, about fifteen feet in depth, the sides of which were steeper than an ordinary cottage roof. Here we thought it impossible for teams to descend, but our leader, Captain Colby, drove down the first five yoke, then ordered a halt, locked both hind wheels, and the wheel cattle went over without injury to the wagon, but a piece of machinery which protruded over the top of the right wagon box, struck into the back of the rear ox and gouged him fearfully. Poor fellow! We only made about six miles this day and at 3 P. M. camped for the night. I found the weather very different on these plains from what it was in Los Angeles. I had thrown aside my under clothing and expected to find it growing warmer, rather than colder as I advanced. It was a sad mistake, and I suffered from cold nearly all the time. The nights were very cold and I crept into the covered wagon and made up my bed on the sacks of corn and barley bound to feed the mules in Slate Range.

APR. 10. Started at 8 A. M. and passed through a very extensive ranch, called Cowangos, a beautiful valley, but no feed to be seen, and was told that a little could be found in the valleys at the foot of the mountains 8 to 12 miles distant; but all agreed that there would be terrible suffering this season among the stock in this county.

About this time we came in sight of the San Fernando Mission buildings. They consist of three great adobe blocks, one for a church and the others for dwellings.

This must have been a very extensive establishment at one time. Now it seems deserted and is all going to ruins. Near the buildings, are two very large orchards, enclosed by adobe walls about 8 feet high, and 8 miles in circumference, in many places broken down by the rains and cattle.

I learn that the mission is owned and occupied by Andreas Pico (brother of Ex. Gov. Pico at Los Angeles,) his son and son-in-law and their families.

I heard from one of our teamsters that in Sept. one could get a great variety of fruit there, but I could see only the olive tree, and the immense cactus which lined the walls, and also grew in great patches in various parts of gardens. This cactus, little specimens of which are trained so carefully in our city gardens and hot houses, here grows fourteen feet high, the base being nearly a foot through, and those immense, flat, green heads shoot out in all directions, wedged so closely that only the smallest animals can move through them. The ripe fruit upon this plant is highly prized by the natives, and is brought into Los Angeles and sold in large quantities.

Camped near by a tile-roofed house near to the entrance to the San Fernando Cañon.

APR. 11. Started at 9 A. M. and soon entered the Cañon, which resembled a great valley at first, but soon began to contract its limits and after an hour or so, we began to ascend quite moderately, and about noon came to the summit, and a steeper, sharper pitch for teams to pass I never saw. For about 200 feet the ascent is as great as can possibly be overcome by wheels. Here the teams were doubled, making twelve yoke on each wagon, and every one of them strained every muscle to the utmost, as well as the drivers, who poured out yells and curses and swung and cracked their great Pike County whips, with all the vim in their constitutions. After a few moments of

terrible excitement the wagon was safely landed in a deep cut of 50 feet on the summit. This work has been done by Lieut. Beal, who has the contract to improve this road and put up toll gates. He has already done a good deal upon it and will be able to continue doing so for years. The descent of the summit is not so laborious but more perilous as there is great danger of the wagon sliding down over the road if not the cattle. With both wheels locked the wagon slides down as rapidly as the oxen can be kept out of the way, the wheelers holding back their very best and frequently getting their ears between the yoke and their horns and cutting them dreadfully, so that the blood runs down their necks and drops to the ground. At 1 P. M. we camped at the Fountain House, a lovely valley where a large stream of pure water gushes out of the hill and fresh grass grows all around for the cattle. We here found ourselves only 31 miles from Los Angeles, after traveling four days. This must appear to any person as slow progress, but teamsters are obliged to give their cattle every opportunity to gain strength in the first part of the trip in order to get over the latter portion, which becomes more desolate and barren as they proceed.

12TH. We made sixteen miles this day and camped in San Francisco Cañon—as we passed along the road, we found the California hare or jackass rabbit very plenty, as many as ten to fifteen in sight nearly all the time within gun shot, and flocks of quails starting up in every direction. The only vegetation thus far is a dry tea bush, and the greasewood which grows in scattering bunches 10 to 30 feet apart all over the country, and occasionally the tree cactus which grows about 10 feet high and is armed with sharp pointed bayonet leaves all over the trunk and limbs and then forms in bunches as large as a man's head, with the points standing out in every direction.

We have met Mr. H. F. W. Hoffman, clerk of J. P. H. Wentworth, Indian Agent, on his return from Owen's River Reservation, with some women, fleeing, as we understand from the Indian troubles in that quarter.

13TH. Remained all day at this camp.

14TH. Started at 8 A. M. and about noon passed Maj. Gordon's Hotel, a commodious adobe house, formerly a station on the Overland Stage Route. Stopped but a few moments and passed on a couple of miles to camp. On our way up the Cañon we were shown the narrow gulch where a man and his family were caught, in the month of August last, by a water spout which overwhelmed the entire party drowned one woman and three oxen and completely wrecked everything. The bones of the cattle were there as a lasting memorial of the sad wreck.

This Cañon is about 25 miles in length, very gradually ascending nearly all the way, and the creek which runs through it crosses the road 92 times between Maj. Gordon's and the mouth of the Cañon, where it sinks, and comes up again about three miles out and then runs into the Santa Clara.

We here met deer on the steep mountain sides and one of our party tried to bring one down with his rifle, but did not succeed. A shot gun is a most desirable weapon on this trip, as with it, there is no occasion to want for fresh game.

15TH. Left camp near Gordon's, passed out of the Cañon and in three hours reached Elizabeth Lake at 11 A. M. Here is good feed and plenty of water, so we camped and stayed over night. At this point there is always a still breeze blowing and generally very cold at all seasons. We were obliged to tie on our hats, and secure blankets around us to keep any way comfortable, as the wind would blow on fire nearly out and when we piled on the wood which we had packed from the Cañon, it would blow the flame flat on the ground for 10 or fifteen feet. A most uncomfortable place.

16TH. Left Elizabeth Lake at 7 o'clock, passed over quite a hill and came upon the great Mohave Dessert. This seems to be endless in extent, like a mighty ocean, lying motionless beyond the reach of vision, with a bright mountain rising occasionally from the plain, like islands. As I passed the summit, met a traveler on horseback, who told me he had seen a fresh grizzly track in the road and I had better keep a sharp look out. I did so but had not the pleasure of meeting his honor, and as I was not armed, did not complain of the sight.

We passed on this desert, the cold wind and rain from

## Mining and Scientific Press.

The MINING AND SCIENTIFIC PRESS is published at the Exchange Building, Room 27, corner of Battery and Washington streets San Francisco, Cal., at FIFTY CENTS per month, or \$4 per annum, in advance.

C. W. M. SMITH and W. B. EWER, - - - - - Proprietors

## Engravings, Electrotypes, etc.

We execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. SKETCHING and ELECTROTYPING. Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Mills, Seals for Plain or Colored Printing. Job Work executed with dispatch at low rates. PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

## To Printers.

AN INTEREST in one of the most flourishing and best paying Newspapers in the mountains is offered for sale on easy terms. A rare opportunity is hereby presented to any printer desirous of establishing himself in a good business in one of the healthiest, most thriving and delightful mountain towns in the state. For further information enquire at this office.

## MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

THIRD YEAR: VOLUME VI.—NEW SERIES!

A new volume of this extensively circulated paper commenced Sept. 11, 1862. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

## The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

## The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

## The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

## To Chemists, Architects, Millwrights and Farmers!

This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

## Terms.

To mail subscribers.—Four Dollars per annum.

## Club Rates.

Five Copies for Six Months, \$16.  
Ten Copies for Six Months, \$18.  
Ten Copies for Twelve Months, \$30.  
Fifteen Copies for Twelve Months, \$44.  
Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 80. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

## EWER &amp; SMITH, Publishers,

Room 27, (formerly) U. S. Court Building, Corner of Washington and Battery streets, San Francisco.

## Our Mint, its Rules, Charges and Operations.

## For parting silver from gold when gold

is below 300-1000ths. fine ..... 3cts per oz.  
" from 30-100ths. to 750-1000ths fine. 7 cts " " oz.  
" " 750-1000ths to 950-1000ths " 14 cts " "

## DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce  $\frac{1}{2}$  per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300 3cts. per oz. gross weight  
301 " 500, 7cts, " " " "

## DEPOSITS FOR FINE BARS.

\$1 16-4-11ths cents. per standard ounce,  $\frac{1}{2}$  per ct. gross value of silver for making bars; also when gold is contained  $\frac{1}{2}$  per ct. on gross value of gold for coining. Refining charges as in purchases.

## BARS SOLD FROM REFINERY.

\$1 21cts. per standard oz.  $\frac{1}{2}$  per ct. gross value to be added for making bars.

## DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz.  $\frac{1}{2}$  per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

## DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz.  $\frac{1}{2}$  per ct. gross value of deposit for making bars.

and many others appear in such a great variety of metalliferous forms as generally to defy all but the most practical and scientific eye. No description of these ores can be written which will afford any very important aid to the inexperienced in making explorations. After reading descriptions, however, and carefully examining the specimens described, the explorer may go out and search with some degree of confidence and intelligence. A study of the characteristics of the sulphureted ores alone, would lead an explorer to pass over, entirely unnoticed, the richest varieties of the ores known as Chlorides or Horn Silver, which, from the facility with which they may be worked, and their usual richness, are generally considered the most valuable of silver ores. There is much reason to believe that this variety of silver ore will be extensively found in all the volcanic regions of this State. So with many other ores.

Considering the great difficulty, in the present lack of cabinet collections, and other means of instruction, to acquire a practical mineralogical and geological education in this State, and desirous to aid, to our fullest capacity, the development of our mineral resources, we hereby make the offer to miners, prospectors and all others, who in their travels or explorations may come across specimens having the appearance of rarity or value, to carefully examine and pronounce upon the same, free of charge, as to their characteristics, value, etc., whenever any such specimens are brought or sent to this office free of cost to us. We have already been called upon in many such cases, and we shall at all times be willing to give our attention to any such requests which may be presented to us.

In carrying out the plan we propose, every miner and prospector should be at all times on the lookout for any new mineral. The ordinary rocks with which the miner meets in his travels and labor, and which possess no mineral value are usually well known. Whenever a rock presents any unusual appearance in conformation, color or other characteristic, attention should at once be given to it. There is scarcely a piece of quartz or rock of a quartzose nature, which presents any uncommon appearance in texture or color that has not been thus modified by the deposit or intrusion of some mineral substance. If such rock is found upon or near a vein of quartz it should be carefully examined "in place," and if the cause of its peculiarity is not evident and readily seen, it should not be passed carelessly by. There may be value in it, although the gold may not shine there. We shall commence in our next issue a series of articles describing as accurately and as intelligibly as possible all the ordinary mineral substances which may be likely to come under the notice of the California prospector. These articles will be published under the head of "THE MINER'S LABORATORY," and will be found of great value to the mining public. [Mining and Scientific Press, April 20.]

SUBSCRIBE.—Are you a miner and not a subscriber to the MINING AND SCIENTIFIC PRESS? If so, you are an annual loser of many times the price of a year's subscription, particularly if you are engaged in quartz mining. The same amount of practical information, important to miners and mechanics, which is contained in a volume of the PRESS, cannot be bought from the shelves of any bookstore in the country for the price of several year's subscription. Do you ever send a paper to the "Old Folks at Home?" If so, and you desire to send important information and valuable reading matter, you can find no paper that will be read with so much eagerness by them, or one that will convey to them so full an account of the real industry of the country as the MINING AND SCIENTIFIC PRESS. We invite all to send us their names and four dollars, or two dollars for six months, and become patrons of the only mining paper printed on the Pacific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examination, and with the hope that it may so for meet with their approval as to warrant their subscribing for it at once. It is not our usual custom to receive a subscriber for less than six months; but inasmuch as we are anxious to introduce the paper where it is not now known, we will, for the present, send the PRESS for three months even, on the receipt of one dollar, in coin or stamps. It is our belief that no one will wish to discontinue the paper after being a constant reader of it for even that short period.

the mountains striking us on our backs for three hours, arrived at Willow Springs about 2 P. M., stayed a couple of hours to rest and water the cattle, and at midnight camped at Oak Creek. This is a beautiful stream of pure water tumbling down the gulch, forming a good mill site every few rods, and plenty of oaks and pines on the hill sides and alluvials in the bottom. Here is good feed and plenty of it, so we remained till Sunday the 19th, 2 P. M., when we topped out our wagon with good sweet hay at \$40 per ton, for the use of the cattle from Cane Springs, El Paso District, Slate Range, a distance of 60 miles and back. While at Oak Creek parties came in from Owens River and reported that all the Slate Rangers had left and gone in to Visalia, from fear of Indians, and also the Miners from the El Paso District; but we concluded to go through and take our chances. Drove on three hours and camped at the sink of the Lechapa.

APR. 20. Drove from 9 A. M. to 11 P. M., rested one hour at Desert Springs, pushed on to Cane Springs, 33 miles from Oak Creek.

While passing over the Desert we frequently saw at a distance small herds of antelope, and the hare were as plenty as ever, but few quails.

At Desert Springs we found the only house deserted, as the owner was too much out of health to remain while we were beyond him were hastening into the settlement.

21st. Started at 5 P. M. and arrived at Mesquit Springs 11 o'clock. This is the central location for the El Paso mines, which are now attracting so much attention. We found remaining here four or five hardy miners who had no fear about them, and who laughed at the idea of running away from the Indians. They had all given Slate Range a trial and after a month or more of prospecting here had come to the conclusion, that this District had greatly the advantage over Slate Range in every respect. The mountains are full of metals, water is plenty, fuel within twenty-five miles and perhaps within fifteen, and supplies are obtained from Los Angeles at about one half the time and labor and about one half the cost.

22. The teams remaining here till toward night we rammed over the hills, examining some of the rich leads, and specimens of others and came to the conclusion that we could take off our freight, stop here and prospect for the present. So here we are settled and will report the condition of things as soon as we get acquainted. C. W. T.

A GRAND UNION PROMENADE CONCERT will be given by the Temperance Societies of San Francisco, in aid of E. H. T. SLIFER, on Thursday Evening, June 11, 1863, at Matt's Hall. Ticket, (admitting Gentleman and Lady,) one Dollar.

## TO MINERS AND PROSPECTORS.

In view of the frequent accidental discoveries of valuable mineral deposits, other than gold, in almost every section of the State, which have of late been made, it is but reasonable to suppose that prospecting even in California, has but just commenced. The simplest and most universal of all metalliferous deposits is gold. It rarely occurs in any other form than that of "free gold" which is readily discernable to the naked eye. An examination of any rock or earth for gold is an extremely simple process. If its presence is suspected in alluvium, the simple washing of that alluvium in a pan is an invariable test. If in rock of any description; the rock pounded fine in a mortar and washed, in the same manner as alluvium, will usually expose its gold to the naked eye, if there is any there in paying quantity. The only exceptions, are where the gold is contained in iron pyrites, or copper pyrites containing also iron. In either of the two latter cases the presence of gold may be readily ascertained by placing the pyrites in any suitable vessel and keeping the contents at a moderate heat for from four to six hours, with frequent stirrings, by which means the sulphur will be evaporated, and the copper, if any is present, changed to a dull red color, and the gold retaining its natural appearance, on subjecting the whole to the usual panning process, may be readily seen by the naked eye.

Not so with other metals. Silver, copper, zinc, nickel,

## THE MINERS' LABORATORY.—NO. VI.

## HOW TO PROVE THE PRESENCE OF COPPER IN MINERALS AND OTHER SUBSTANCES.

In order to proceed in a legitimate manner, to discover the presence of copper in minerals and other matrixes, it is necessary that the miner should be made somewhat acquainted with the chemical tests for pure copper and in order that he may be made so acquainted, we will set before him some few of the prominent ores and how to obtain them.

Dissolve about  $\frac{1}{2}$  oz of the sulphate of copper (blue vitriol) in about 6 oz. of water, divide the solution into six parts and proceed as follows:—

To No. 1, add a small quantity of the sulphide of ammonium which will immediately give you a black precipitate of the sulphide of copper.

To No. 2, add a solution of soda, which will immediately throw down the hydrated oxide of copper in the form of a green powder, which will become black on boiling.

To No. 3, add a drop or two of the solution of ferrocyanide of potassium, this will give no precipitate, but will give your solution a mahogany color.

To No. 4, add ammonia in excess and you will obtain a very deep blue colored solution.

In No. 5, place a strip of bright iron or zinc and a few drops of hydrochloric acid (muriatic acid) and the copper will be deposited in a metallic state on the iron or zinc.

It would be well that those prospecting for copper should make themselves perfectly familiar with the above tests.

Having given you a few of the most reliable reactions of copper with reagents. I will now describe to you how to prove the presence of copper in minerals, &c. The substance to be examined for copper must in the first place be reduced to very fine powder and if insoluble in water must be dissolved, if green color in hydrochloric acid, and if black or yellow in nitric acid. Vaporate the excess of acid after complete solution and dilute with 4 to 6 times its bulk of water and divide it into two parts. To No. 1, add ammonia in excess and you will obtain a deep blue solution, if copper is present. It is very probable the solution will be muddy at first—allow the solid matter to subside in order that you may examine the solution.

In No. 2, you must place a strip of bright iron or zinc—if copper is present it will be deposited in the metallic state upon the zinc or copper. With these two tests, one confirming the other, you cannot fail to discover the presence of copper.

## APPARATUS AND CHEMICALS REQUIRED FOR CONDUCTING THE ABOVE TESTS.

- 6 Glass Test Tubes.
- 1 Small Glass Funnel.
- 1 Spirit Lamp.
- 1 package of Filtering Paper.
- $\frac{1}{2}$  lb. of Ammonia— $\frac{1}{2}$  lb. of Nitric Acid.
- $\frac{1}{2}$  lb. of Hydrochloric Acid—1 pint of Alcohol.

The value of the whole would not exceed \$5 00.

## THE COMPARATIVE VALUE OF SOME OF THE MOST COMMON OF THE ORES OF COPPER.

*Native Copper* generally occurs almost pure, and in almost every conceivable form, as massive, granular, siliform (thread like), arborescent, in thin lamina, etc. When found associated with other metals, such as silver, for instance, the two metals usually occur in juxtaposition, simply, and not combined, a condition which they readily assume when melted together in the crucible.

*Sulphuret of copper* is a very rich ore, yielding copper 76.5; Sulphur 23; and iron .5.

*Red Oxide of Copper* is a very rare and rich ore. Very little, so far as we have learned, has yet been found in this State. When free from earthy impurities its yield is 88 @ 91 of copper, and 9 @ 12 of oxygen.

*The Black Oxide of Copper*, in its pure state yields from 70 @ 80 per cent. of copper. Both the black and red oxide yields readily in the reducing flame of the blow-pipe a globule of copper.

*Variogated Copper Ore* (Peacock Ore) gives 50 @ 56 per cent. of copper, and promises to be quite common in the mines of this State.

*Copper Glance*, or *Reddishite* yields from 70 @ 79 per cent. of copper, when quite pure, and in that condition may be readily melted in the ordinary flame of a candle.

It sometimes, though rarely, occurs in connection with Bismuth, when it falls as low as 18 to 20 per cent.

*Antimonial Copper* is neither very common or rich. It yields 20 @ 25 per cent. of copper.

*Green Carbonate of Copper* (Malachite) in its pure state contains 57 per cent. of copper.

*Blue Carbonate of Copper* is usually a richer ore than the green and contains from 65 @ 70 per cent. of copper.

*Gray Copper*, is a very rich and promises to become a quite common ore, in this State. Its yield of copper is from 40 @ 50 per cent. This ore often contains as high as ten per cent. of silver, and sometimes a small quantity of quicksilver.

*Copper Pyrites* is the most abundant of the ores of copper and usually about the poorest. Its yield is greatly affected by the presence of iron and varies from 12 to 30 per cent—rarely, however, reaching 25.

If tin is ever found associated with Copper in California, it will probably be with this description of ore. When so found it is usually in about the following proportions:—Copper 30; tin 26; iron 14; sulphur 30.

## INDICATIONS OF TIN PYRITES—ASSOCIATED WITH COPPER.

*Tin Pyrites* occurs massive, like copper; its lustre is metallic, with streak black; color from steel-gray to iron-black, sometimes presenting a bluish tarnish, with an uneven fracture. When heated in an open tube it gives off sulphurous fumes, with a slight sublimate of the oxide of tin. On charcoal, with the blow-pipe, the sulphur is first expelled, after which a dark scoriaceous (pertaining to dross, like the dross or scoria of metals) globule is obtained. The charcoal will also be coated with the oxide of tin. With soda, a globule of impure copper is obtained.

This species of pyrites may be more confidently looked for in a granite rather than a slate region. Copper miners will do well to keep a good lookout for this mineral, as, if found it will be a valuable ore.

*Arsenical Copper* (Domeykite) which may be known by its reniform and botryoidal appearance, (veniform, having the shape or form of kidneys; botryoidal, shaped like a bunch of grapes) is a very rich, though somewhat rare, ore. It yields, when pure, about 70 per cent. of copper, and 30 of arsenic. Its composition sometimes varies so as to bring the copper as low as 60, with arsenic 20, and 20 parts of iron and sulphur.

*Sulphate of Copper* yields about 25 per cent. of metal, and occurs irregular in shape and in three-sided crystals, with a glossy lustre, approaching to sky-blue, in lustre. This mineral is often found dissolved in the water which issues from the mine. The copper from these waters is obtained by precipitation with iron. At a mine in Wicklow, 500 tons of iron were laid at one time, in the pits into which the water was collected, and in about twelve months, this iron was all decomposed or dissolved, and each ton of iron was found to have deposited two and a half tons of a reddish mud, which was an oxide of copper, and which upon proper treatment yielded 16 cwt of pure copper to each ton of oxide.

**COPPER ORE.**—The Steamer Panama, which arrived here from the North last week, brought down several tons of very rich ore from the Del Norte Copper region. The Mammoth Company sent a quantity of sulphurets of extraordinary richness. The Evoca sent about 100 bags of rich oxides. The Mines of the Del Norte region are being rapidly developed, and are promising to be exceeding rich in both quality and quantity of ore.

At last reports there were some 500 tons of copper at Stockton, on its way to this city for shipment East. This ore is from the Napoleon, Union, Keystone and other mines in Calaveras. The amount of copper ore now coming forward is beginning to be quite important—although but a small portion of that which is being raised.

**LAKE BIGLER.**—This beautiful sheet of water covers an area of about 300 square miles, and is 6,000 feet above the level of the sea. It is engulfed between two ridges of mountains which form on either side some of the highest peaks of the Sierras. The central portion of this lake has recently been sounded to the depth of 2,400 without finding bottom.

## NEW MAP OF THE UNITED STATES.

We have now hanging up in our office the most accurate and complete Map of the United States, which has ever been published. In size it is about 40 by 50 inches, and contains the names of 300,000 Towns and 31,000 Railroad Stations, all distinctly lettered. Every Railroad in the United States and the Canadas, with every Station established prior to June 1862, is clearly and distinctly laid down on this Map, as well as all the principal Rivers, Fortifications, Battlegrounds, etc., up to the above date. The Map is divided off and colored in Counties, and has been prepared at great cost from actual surveys. The Maps prepared by Mr. Lloyd, are used by the Officers of the Army and Navy everywhere, throughout the Union lines, under the sanction of the Secretaries of War and the Navy. So confident are the publishers of its accuracy that the Map bears upon its face the following note, distinctly printed in large type:—"Any one finding an error in this Map will be entitled to a copy, gratis, by writing to the publisher." The Map is sold only by Canvassers. An Agent is now canvassing the City for its sale. No Dwelling, Office, or Counting-Room should be without a copy. This Map is published by J. T. Lloyd, and should not be confounded with an inferior publication by H. H. Lloyd.

**PROSPECTING MACHINERY.**—Quartz Miners and Prospectors at the mines, desirous of having their ores practically tested in this city, can have every facility for doing so by forwarding them to Mr. Williams' Reduction Works, near the Miners' Foundry, at 261 First Street. Mr. Williams has several machines in operation at his establishment, among which are Pond's Crusher, Kimball & Ellis' Stamp Mill, Howland's Grinder for Quartz Tailings, etc. The quartz thus reduced can be carefully amalgamated in Wheeler's Pans, or by other processes, as may be desired.

## REMARKS

The limited transactions in the Mining Share Market, heretofore noticed, still continue. It is a gratifying fact, however, that this cessation in de-

mand is no indication of a want of confidence in stocks of heretofore accepted value. Stocks of well ascertained merits fully maintain their position, and the shares of progressive mines of this description, keep pace, in their advance with developments at the mines. The present reaction, has thus far, had no effect to diminish confidence in legitimate mining operations anywhere. Dividend paying mines are becoming regulated by the dividends which they pay, and progressive mines are estimated by their actual developments, while fancy stocks are held mostly in abeyance, or, when dealt in, regulated by fancy prices alone. This condition of the market, has put a pretty effectual check upon speculative operations, to the lack of which, alone, may be attributed whatever exists of present inactivity.

Ophir shares remain at about uniform rates by reason of the continuance of small dividends. Another dividend of \$48 to the foot was declared by this Company, on Saturday, payable to-morrow.

The recent heavy payments of the company to perfect their title and to acquire additional ground have been the cause of their late low rate of dividends, and the important additions now being made to their reduction works, by purchase and construction will probably continue low dividends for some time to come. The stock, however, in most hands remains firm and is held at rates now ruling, on the conviction that its intrinsic value is constantly improving, and that when the additional machinery now in progress of erection shall be put in operation, dividends will advance beyond the highest limits of the past, and carry up the stock to a figure proportionally in advance of past rates.

Gould & Curry, by reason of its high dividends, and the confident anticipation of their further improvement is largely sought after at constantly improving rates. Holders are sanguine of \$150 per foot for future dividends.

The Empire Mill and Mining Company situated on Gold Hill, N. T., is a recent incorporation with a capital of \$1,000,000, divided into 1200 shares, and holding 75 feet of ground in Gold Hill proper, with a 21 stamp mill, ready. The first appearance of their stock in this market is noted by Sanborn's Circular of Saturday last, as selling at \$1,000. The Company was organized April 1st, last, and has paid 3 per cent. per month dividends, on their capital stock since that time.

Eight and a half feet in the Mexican Claim was recently sold to New York parties, at the rate of \$8,000 per foot. This covers all the stock in this claim that can be had at any price, and concentrates the whole in a few hands. This is the highest price ever paid for mining ground, and is no doubt a splendid investment at that.

The Grass Valley Company has recently instituted a suit against the Potosi, with what is considered, by its friends, as a formidable array of evidence in support of its title, and it has rapidly advanced of late and may now be quoted in this market at from \$80 to \$100, although our correspondent at Virginia City quotes it at half these figures in that market. There is but very little of the stock in the market.

Some fluctuations during the past week, will be noted, by reference to our reports of the Stock Board, and General Report of Sales, for the week.

We have arranged our "Report of Sales," in such a manner as to convey to the reader a very correct idea of the pulse of the market during the week, exhibiting the rise and fall of the various stock, as these movements take place from day to day. We shall hereafter continue that arrangement.

## REMARKS.

Little of moment has transpired in the Virginia M. & N. since the date of our last reference. Trade has been comparatively light, although the disposition to move is quite as apparent as at any time during the Spring. Capital, however, is becoming somewhat more cautious, and funds contentment in less profit than heretofore and in less risk.

Among the fluctuations of the past week in stocks which receive their value in the Virginia market, we may point to the Utah, the Bajazette, the Burnside, the Belvidere, the Birdsall, the Fairview, the Texas, the North America, and a number of claims of value in Gold Hill district. The Burnside is not salable at over \$20, the Belvidere at over \$25, the Birdsall at over \$30, the North America at over \$20, the Texas at over \$7, the Utah at over \$65 @ 70, the Sutor at over \$15. The Fairview has advanced to \$200, the Bullion to \$80 @ 85, the Princess to \$90 @ 95, Hazel Green to \$5, Sacramento to \$70 @ 72, Wm. Penn to \$14 @ 15, Lafayette to \$12 @ 15, Insurance to \$25 @ 30, etc. La Crosse and Madison are marketable at our quotations. The talk of a compromise between the Belcher, Koh-i-noor and, perhaps, the Sinaloa, has created a firmness in these stocks which has almost ruled the two former from the market. Rumors of a compromise between the Yellow Jacket, Princess and Union are again in circulation, but we cannot vouch for their reliability.

No new discoveries of importance have been made during the week, with the exceptions, to our knowledge, of the striking of the Durgen ledge by the Bloomington Co. in Mt. Davidson, the finding of fine looking ore in the Indus, and the improvement of the ore in the El Dorado.

## REMARKS

A favorable change has taken place in the Stock Market the past week.

The injunctions in which the Del Monte Consolidated Mining Co. were plaintiffs, on several valuable ledges on Last Chance Hill, having been dissolved, a large amount of work is now going on, and sufficient rock is being taken out to supply one third of the mills in the District.

Several new ledges have recently been struck and a large amount of ground has changed hands in the District, the past few days, at advanced figures.

The Gen. Hooker Lode on Silver Hill is still increasing in richness. The main shaft is now down about 60 feet and the ledge over 5 feet wide. Over 100 tons of rock have been taken out ready for crushing.

The Crittenden Lode on Last Chance Hill is turning out rich rock. The tunnel is now in about 40 feet and the Company are drifting on the ledge which is over 5 feet wide.

The Juniata Lode on Martinez Hill is turning out some of the richest gold bearing rock in the District. The tunnel has struck the main ledge 200 feet below the surface. The ledge is about 6 feet wide. The contractors will now commence drifting on the ledge in both directions and will be able to take out 20 tons per day. The rock assays \$900 per ton.

The Great Britain shaft is now down about 70 feet. The ledge is over 5 feet in width and increasing in richness. The last crushing paid \$40 per ton. The Company have about 75 tons of rock lying at the shaft ready to be sent to the mills.

The Crockett Ledge on Last Chance Hill is turning out good pay rock. The shaft is down 50 feet. The ledge is over 4 feet wide. The rock is being crushed at the Brodie mill.

Mr. West, the inventor of an improved Amalgamating Pan, is now having one, of mammoth dimensions, constructed at the Miners' Foundry, which will be worked upon an improved Patio process. The pan is some 18 feet in diameter and weighs nearly eight tons. It has been constructed for for a Mexican mine in the District of Durango, and will be shipped in a few days, together with a large quantity of other machinery for the same mine.

The House is conducted on Temperance Principles, WHICH SECURES TO OUR GUESTS QUIET.  
The prices for board and Rooms are very moderate--by the day, meal or week. WE SOLICIT A CALL FROM ALL.  
F. E. WEYGANT, Proprietor.

For the accommodation of my many guests I have taken and refurbished the INTERNATIONAL Hotel, and will carry on the two houses in connection, so that Travelers wishing to put up at either house, may take the Tremont or International Hotel Coach and be taken to either House with their baggage, FREE.  
F. E. WEYGANT.

**Volcanic Smelting Furnace.**

**PERSONS DESIRING INFORMATION AS TO THE USE** and economical properties of this Furnace, and intending to make use of the same, when satisfied of its superiority over all other means of reducing ores and separating metals from the sulphurets, can obtain all needed explanation and advice in regard to the same, and the terms of sale of rights to use the same, on application Col. J. D. Stevenson or T. Ogg Shaw, or by letter to the proprietress through the Post Office of San Francisco.  
Drawings may be seen at the office of Col. J. D. Stevenson, No. 614 Merchant street, or at the office of T. Ogg Shaw, in Brannan's Building, Montgomery street.

The time required for reducing ores by this Furnace is from three to eight hours, and the amount of fuel only one-tenth as much as is consumed by other processes.

The process of condensation is applied to this Furnace which will save all those portions of precious metals which usually escape in a volatile form.  
The attention of all interested in the subject is requested to examine the important results obtained by this process.

Parties wishing will be allowed to erect a trial Furnace of capacity for smelting one ton of ore or more, on signing an obligation to pay the usual fee for the right to use it, should they continue to make use of the invention or a longer period than two months.  
mch 16 MRS. E. J. HALL, M.D., Proprietress.

**LEANDER RANSOM,**  
**Civil Engineer**  
AND  
**SURVEYOR,**

Having been connected with the public works of the State of Ohio for 20 years, and the public surveys of the State of California for 7 years.

**ALSO**

No. 44 Leidsdorff street,  
Opposite the What Cheer House, San Francisco.

**To Mine Owners.**  
**PARTIES having a Good silver Mine** and wishing for Machinery to work it for an interest in the Mine Will do well to apply at this office. No organized company need apply.

**50 lbs. MARINE and Fire-Proof Paint,**  
MANUFACTURED BY THE PACIFIC METALLURGICAL Works in this city, for Hulls and Decks of Vessels, from ground Miners Rock contains Arsenic, Copper, Litharge and six other Minerals. When used on the Decks or Bottoms of Ships, it is equal to a coat of Stone, and quite equal to Copper, no worms will ever effect it, and cheaper than any other paint.

**DIRECTIONS:**  
For Decks of Ships, use two parts Mineral Paint, one part White Lead, mix with Linseed Oil.  
For Bottoms of Vessels, use one part ground sulphur three parts Mineral Paint, mix with Coal Tar and apply it hot.  
For sale by all Ship Chandlery and Tradesmen, in boxes of 50 lbs. each, or by the Pacific Metallurgical Works.

**25 POUNDS FIRE-PROOF PAINT.**  
When used on Roofs, Buildings, or Fences, it is equal to covering them with a coat of Stone, being perfectly Fire Proof, and costing less than any paint.

**DIRECTIONS:**  
HOUSE:—Mix three parts Mineral Paint with one part white lead, thin with Linseed oil: if a lighter color is wanted, mix less paint, more lead.  
ROOF:—Five parts of Mineral Paint, one part white Lead, mix with Linseed oil. Put it thick on a tin Roof as one coat when properly applied will last three years.  
S. C. BRADSHAW, Agt.,  
G. T. Fouque, Superintendent.  
**WORKS, North Beach; Office, 318 California st., San Francisco.**

**WRIGHT'S PICKS.**  
JOHN WRIGHT, of Sacramento, has established himself in San Francisco for the manufacture of every description of PICKS, of the best material, at reduced prices. Pick Eyes of the best iron furnished in any quantity, at low rates. Orders from the country promptly attended to. N. B.—None genuine unless stamped with my name. JOHN WRIGHT, 511 Market street, Opposite Battery, San Francisco.

**REMOVAL.**  
**OFFICE OF THE PACIFIC METAL** lurgical Office is removed to 318 California street. Having enlarged our Works at North Beach, we are now enabled to reduce from 10 to 15 tons of Silver or Gold rock per day.  
Gold and Silver ore, and Sulphuret Assayers', or Silversmiths' sweepings reduced or purchased.  
COPPER ORES—Highest market rates advanced in cash, for shipments. S. C. BRADSHAW, Agent,  
318 California street, near Sansome.

**WANTED,**  
**GOLD QUARTZ SUITABLE FOR CUTTING JEWELRY,**  
BY FRONTIER A. DEVERCY,  
13 ap 487 Pine street, San Francisco.

**FREDERICK MANSELL,**  
**MECHANICAL & ARCHITECTURAL DRAUGHTSMAN,**  
No. 422 California street, corner of Leidsdorff.

## SPECIAL NOTICES.

**Office of the Ophir Silver Mining Co.,**  
San Francisco, June 6, 1863.—A dividend on the capital stock of this Company has been declared, payable on and after the 9th instant.

The Transfer Book will be closed until the 9th inst.  
THOMAS J. LAMB, Secretary.

**Office of the Table Mountain Copper Co.**  
An assessment of Twenty-five cents per share was this day levied upon the capital stock of this Company, payable immediately, in gold coin of the United States, to the Secretary, at the office of the company, No. 528, Montgomery street.

M. G. ELMORE, Secretary.  
San Francisco, May 18, 1863.

**The Annual Meeting of the Stockholders** of the Table Mountain Copper Company will be held at the Office of the company, No. 528 Montgomery street on the second Monday in June next, at 7 P. M.

M. G. ELMORE, Secretary.  
San Francisco, May 18, 1863.

**Office of the Nevada Copper Mining Co.**  
March 24, 1863.—At a meeting of the Board of Trustees, held this day, an assessment of Forty Cents per share was levied upon the Capital Stock of the Company, payable twenty (20) cents per share within thirty days, and twenty (20) cents per share within sixty days from this date, to the Secretary. By order of the Trustees.  
J. ARMSTRONG, Secretary.

**Office of the Tennessee Gold and Silver Mining Company, No. 7, Montgomery Block.**—At a meeting of the Board of Trustees held April 22, 1863, an Assessment of One Dollar and Fifty Cts per share upon the capital stock of said Company was levied, payable on or before Saturday, the 13th day of May, 1863.

J. H. BLOOD, Secretary.  
San Francisco, April 27, 1863.

(Near Clay.) San Francisco.

This Establishment is now generally known to be the Cheapest Place in the City for good Bedding.  
Branch Store.....Road St., Nevada.

**WHEELER'S**  
**Amalgamating and Separating Pans.**

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of triturating, and in cleaning up. By the introduction of the Separating Pan to follow the triturating this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated on the side of others on the same fact, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

\*As These Pans may be seen in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves.  
no16-tf ZENAS WHEELER.

A JOURNAL OF MINING, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

EWER & SMITH,  
PROPRIETORS.

VOL. VI.

SAN FRANCISCO, MONDAY EVENING, JUNE 15 1863.

NO. 33.

The accompanying cut represents the Amalgamator invented by Mr. THOS. VARNEY of this city. The inventor resided in Virginia City from Nov. 1860 to Dec. 1861. During that time the extracting of metals from their ores, particularly silver, having become a matter of deep interest to many, he was led to examine the machinery in general use for amalgamating, and became convinced that it could be improved. From that time to the present he has devoted his time and attention entirely to this subject.

His theory is, that to extract the precious metals from their ores, particularly silver, the ores must be reduced *very fine*—that ores will continue to yield metal as long as the particles can be reduced in size and that no process can extract the metal by amalgamation until the ore is made fine.

Further, that the particles of metal as soon as liberated, should at once be brought in intimate contact with quicksilver; hence he deems it necessary to pulverize the ore in the presence of quicksilver, but the machinery should be so constructed as to grind the quicksilver as little as possible.

Furthermore that the apparatus heretofore in use has been too slow in its operation, making too much machinery necessary.

Like most valuable inventions, this machine has passed through a regular series of improvements, from its commencement to the one above illustrated. It seems to us that this Amalgamator is a very great improvement on machinery heretofore in use, and the great demand for them goes to show that others think as we do.

To explain the operation of this invention we copy from the specifications in the patent granted Dec. 16, 1862.

"This invention consists in the employment or use of a rotary and stationary muller placed within a suitable pan or tub, provided with a cover and arranged in such a manner that when the device is in operation the ore will pass in a current or stream outward from the centre, and between the mullers to the circumference of the same and thence onward over the upper rotary muller to the centre of the same, and down through said muller, between it and the lower stationary one, to be again thrown to the periphery of the mullers; thereby causing all the particles to be brought in contact with the quicksilver, &c."

This invention also consists in the employment or use of curved or spiral scrapers, placed within the pan or tub, and arranged relatively with the upper surface of the rotary muller, in such a manner as to insure the passage or movement of all heavy substances in the pulp, along with the current, &c."

The machine which we illustrated in this paper some time since, called "Wheeler's Amalgamator," is in principle and mode of operating, similar to the above. A suit is now pending in the U. S. Circuit Court, between Mr. VARNEY

VARNEY'S AMALGAMATING PAN.

and Mr. WHEELER and others for infringement.

These Machines work 1000 lbs. at a batch, and will complete three tons in twenty-four hours. They are manufactured by DONAHUE, BOOTH & Co., at the UNION FOUNDRY in this city, and the workmanship is superior to anything we have seen in Amalgamating Machinery.

**TONS OF BULLION.**—According to the Territorial Enterprise, the daily shipment of bullion from Nevada Territory, at this time, is *two tons*. Two tons of bullion, as it comes from the Washoe mines, is worth about \$125,000; and that amount per day would give *three and a quarter millions per month*, or \$39,000,000 a year. These are pretty large figures; but perhaps the present shipments are being made from a surplus of past accumulations, which will soon become exhausted and so let down the yield, in a short time, to a reasonable figure—say *one million per month*. Washoe will be entitled to all the credit in mineral productiveness, that any similar extent of population need ask for, if she will only come up to the latter figure during the ensuing twelve months.

**WAR RISKS.**—The increasing depredations upon our commerce by the English-confederate pirates, has had the effect to materially increase the charge for war risks upon vessels passing from the Eastern States or Europe to California. The war risk has been gradually advanced, until it has now reached 10 per cent., which, with the ordinary charge of 2½ @ 3 per cent., makes a very heavy tax on general merchandise seeking a market in this State.

The Gipson Quartz Mill, in Tuolumne county, turned out \$5,000 week before last.

**EFFECT OF PRESSURE ON ELECTRO-CONDUCTING POWER.**—M. Elie Wartmann has found experimentally that the electric conductivity of copper wire is sensibly diminished by a pressure of 50 atmospheres, that this diminution increases with the pressure, and disappears when the pressure is relieved. The experiments were carried up to 400 atmospheres. These results establish a new analogy between heat, light, and electricity.

**THE ENTERPRISE GOLD & SILVER MINING COMPANY** recently filed their certificate of Incorporation, with a capital stock of \$100,000, in 1000 shares of \$100 each. C. A. James, President; Rodney Clark, Secretary. The mine of this Company is located in the Colorado District, Mexico.

**Plumbago.**—The Ione Copper Mining Co., at a depth of about 35 feet, have struck black lead, about two feet wide, said to be of an excellent quality.

The coinage of the United States Mint, of this city, for the month of May amounted to \$2,206,000.

#### REVENUE TAX UPON PRODUCTS OF IRON FOUNDRIES.—

The Commissioner of Internal Revenue has made the following decisions with reference to taxes imposed on various products of iron.

1st. All steam engines, whether marine, locomotive or stationary, are subject to a duty of three per cent ad valorem.

2d Cast-iron shafting is liable in all cases to a specific duty of one dollar and fifty cents per ton, under the act of March 3d, 1863. Wrought iron shafting, if held to be manufactured within the meaning of division No. 71, is liable to a tax of three per cent ad valorem.

3d. Railroad car-wheels are taxable in all cases, one dollar and fifty cents per ton. All other castings of iron exceeding ten lbs in weight, not otherwise provided for, are taxed one dollar and fifty cents per ton, by act of March 31st, 1863.

4th. Castings of all description made exclusively for instruments, articles or machinery upon which duties are assessed and paid, are exempt from duty under section second, act of March 3d, 1863.

5th. Castings not exceeding ten pounds in weight, which are so well known and so generally used as to have a commercial value in themselves, are taxable three per cent ad valorem, when not otherwise provided for.

**NO DRAFT IN CALIFORNIA.**—The draft will soon be enforced in the East, but it is stated that there will be no draft ordered in California, unless a foreign war or an important demonstration on our lower borders should make it necessary to raise troops here.

**REMOVAL.**—Mr. Wm. Shiels has removed his office from its former location on Merchant Street, to 309 Bush Street. Mr. S. is largely interested in the Copper interest.

## THE MINERS' LABORATORY.—NO. VII.

## METALLIFEROUS TREATMENT OF PYRITES

No mining district in the world, probably, is more prolific of Pyritous ores than the State of California and the adjoining Territory of Nevada. The treatment of Pyrites, for the metals of gold and silver is one of the most difficult of metallurgical processes, and one in which but few have succeeded. Perhaps no one on the Pacific Coast has been more successful than Mr. DEETKEN, at his works near this city, on the San Bruno road. Millions of dollars have, without doubt, been allowed to pass away in the auriferous pyrites contained in the tailings of our quartz mills, which have been allowed to run down the creeks and ravines near which the mills are usually placed. The treatment of these stubborn ores is a matter involving great chemical skill, and has been made the subject of much study and experiment. Hence any suggestions on this subject coming from sources of acknowledged skill and experience, are ever deemed valuable. Mr. Deetken's process is known as the "Hydrochloric process, and his *modus operandi* was fully described by our predecessor in this paper, about one year ago. We have long intended to visit this establishment and again speak more fully of it, and shall endeavor to do so soon.

In the concluding portion of this article we have alluded to "Keith's Desulphurizing Process," which was fully described in our issue of the 2nd of March last. Our present purpose is to lay before our readers the ideas of a practical Metallurgist of Washoe, upon this subject, as communicated to the Washoe Times, from which we quote.

"The necessity for the sulphurated ores being reduced to a powder as fine as flour, must be self-apparent to every one as it is connected and combined with two of the most subtle matters known, sulphur and arsenic, both of which, we will hereafter show how they may be effectually discharged without loss to the valuable contents of the ore. It being the fact that these two substances pervade the whole body of the ore, it is clearly evident that the ore must be reduced to the finest powder, ere their enemies can be attacked with a certainty of overcoming them. To effect this, the ore should, after it leaves the stamps, pass through a series of sieves, say three in number. These can be very inexpensively arranged, in a case or housing lined with sheet zinc, which will prevent any of the material from escaping, and entirely preclude any annoyance to the parties engaged in the reduction works. These sieves should be so arranged that the coarser parts of the ore shall be deposited in a chamber for their reception, in order that they may be recrushed, and the finest received in a bin by itself.

As stamps appear to be the usual mode adopted in this country for crushing the ore, we have treated of their use first; but the best method of crushing these ores, is by a crushing mill, composed of three pair of cast rollers, with chilled faces, which are easily renewed, and with the sieves attached. By this method the ore is reduced to the finest powder, as none but that fit for use comes down; the coarser particles, that will not pass through the sieves, being carried back to the upper hopper of the mill without any manual labor, and without the smallest loss either of power or material. This method requires little or no attention, and thereby saves much expensive labor. We will assume that there is a bin filled with finely powdered ore. Now, let us examine what we have in this compound. Here is iron in arsenicated sulphuret, arsenic in the mass, as well as in association with the iron, sulphur admixed with all the material, and silver diffused in the same manner in particles as fine as the sulphur itself. The first ingredient to be attacked is the iron, which we have shown is an arsenicated pyrites. Having this matter in a highly-pulverised state, there is no difficulty in altering its whole chemical feature, by converting it into an oxyd. This is not a very costly process, the reagents for accomplishing which would not cost, in this country, more than five dollars for a ton of ore. This process requires a few days, according to the amount of iron that the ore contains. The whole material will now be in color, from a slate gray to a light reddish brown. In this state the iron will give forth any of the precious metals that may be held in combination. Having subjugated enemy number one, we now attack the combined antagonists of arsenic and sulphur. This is effected by placing the oxydized material into a large wooden vessel called a desulphurizer, having first admixed with it the reagents that will cause it to give forth both the deleterious materials with which it is charged. The cost of these reagents would be from three to four dollars to the ton of ore. Each desulphurizer should hold from one to two tons of ore, or they may be made larger should it be required. This wooden vessel is made steam tight, and is filled by a run hole on the top. To it is attached two or three pipes, with cocks, by which steam is admitted, and the whole mass is kept in motion by the means of wooden arms, attached to a shaft of the same material, which is moved slowly by any power that the works

may have adapted. By this method the reagents are admixed through the most minute portions of the ore. On the top of the vessel is fixed an iron gun-barrel pipe, in which is a stop-cock, which is kept closed at the commencement of the process, but opened gradually as the heat advances. The desulphurizer is never filled to repletion; therefore the space unoccupied by the ore is filled with sulphurated arsenicated hydrogen, which is allowed to pass off through the gun barrel pipe, which should be long enough to carry off the vapor to some distance from the works, as the flour of arsenic will fall in coming in contact with the air; or, a safer plan is to carry the pipe, with an inverted discharge, into a tank of water placed sufficiently high to receive it. This tank must be used for no other purpose; the flower of arsenic will be precipitated there, and no deleterious effects will be communicated to the air. This process of removing these two ingredients will occupy from two hours and a half, according to the amount of sulphur, arsenic and sulphurous acid that the ore contains. The appliances to effect this object are also inexpensive in their character, even in this country. This simple method of desulphurization precludes the necessity of using either the roasting or reverberatory furnaces; it does the work required with more ease, and more effectually and much more economically, and without any loss of the valuable contents, and also without any annoyance to the men employed—as there is no dust or pernicious vapors thrown off in the buildings—and the labor is lessened by two-thirds, as one man can well attend to three vessels; added to which there is no loss of a portion of the metallic contents of the ore, as in the use of the reverberatory furnace, in the use of which—the ore being a sulphuret and brought in contact with the fire—the combustion that takes place in working the ore, causes the gaseous portions to be given off as a sulphurated, arsenical hydrogen gas, and combustion carries with it a portion of the silver. This can easily be proved, by placing a piece of silver in a covered crucible with some powdered sulphur and arsenic, and placing the same in a white heat for half or three-quarters of an hour and then removing the cover of the crucible; when, immediately, the oxygen of the air comes in contact with the contents and a brownish vapor will commence to ascend, and, if allowed to remain in the fire a few minutes, on removal, the silver will be found to have been volatilized and passed off in gaseous vapor.

J. B. TRUCKEE.

In a subsequent communication to the Time, "J. B. Truckee" writes as follows in allusion to the "Keith Process":—

"The method of the reduction of the ore to a fine powder, by the means of a hollow drum, with the edge runner fan inside, I have no doubt is a very efficacious and quick method of bringing the matrix to the pulverulent state in which it is uniformly required, and which is a very primary desideratum, and one to which too much attention cannot be paid. \* \* \* I am of opinion that the desulphurizing process is not so good as the one which I mentioned in an article in your Journal of March 7th [The article here referred to is the one we have copied above—Ed. Press.] and for several reasons:—

First, the use of fire in the operation of desulphurization must be attended with some loss of the valuable contents of the ore, which is an arsenicated sulphuret, by the fact that the heated ore, must, in throwing off its sulphur and other deleterious matter, in a gaseous form, and in contact with the oxygen of the heated air, carry with it a portion of the sulphuret of the silver contained in the ore, which must be evolved and pass off thereby making a serious discount on the percentage of yield in the results. This loss will be necessarily increased according to the larger amount of sulphur etc. contained in the ore. In fact, this plan is open to the same objections, as the use of the reverberatory furnace, and must secondly, be far more expensive than the simple method spoken of in the paper above referred to. By the use and admission of steam to the vessels there described, and the perfect manner of the admixture of the simple reagents, the desulphurizing is effected at the least possible expense, and in the quickest possible time, in the most efficacious manner, and without the possibility of the smallest loss of the valuable contents of the ore, from the deprivation of any of its valuable contents. I do not wish to be thought egotistical in my views of this subject, as I have no patent for this simple process, but merely introduce it in the place where it stands, in the series of papers, for the purpose of showing how easily the most subtle foes to the extraction of the silver from sulphurated ores could be subdued and entirely dispelled."

## THE "KEITH PROCESS."

A correspondent of the Washoe Times appears to be very desirous to learn something about the cost, etc., of the machinery employed at the Pike's Peak Mines for reducing quartz in connection with what is known as the "Keith Process," remarking that "It would be of great general benefit could the inventor (Mr. Keith) furnish us with some data as to the cost of the drums, and copies of the drawings or lithographed plans of the invention, and the amount of royalties that he would require for that portion which is patented."

The machine referred to is a Rotary Crusher, known, we believe, at Pike's Peak, as the "Young America Crusher." The method of reduction is by the rapid revolution, in a hollow drum, of a set of arms or beaters. These arms are made to revolve, i we mistake not, at the rate of ten or twelve hundred rotations a minute. The quartz being thrown into the machine through a hopper, is instantly reduced to a powder by the rapidity of these beaters, and forced out in a very fine dust by the current of air provided by the rapid motion.

This machine can be obtained at the Golden State Foundry in this city. Messrs. Palmer, Hanscom & Co., the proprietors, have already constructed several of these machines, for a Mexican Company, under the direction of Mr. Leeds, who has used it in the Atlantic States. The cost of the machine is about \$300, and it will weigh, all ready to run, about 1300 lbs.

The use of this "pulveriser," as it may properly be termed, requires a first breaking up of the quartz into very fine fragments. Say to the size of hazlenuts. The best machinery to accomplish this portion of the work, with which we are acquainted, is "Blake's Stone Breaker." This machine has a world-wide reputation as an efficient and reliable agent for the reduction of rock of any kind to small fragments, such as are required for macadamizing roads, manufacturing concrete, etc. It is also very generally used by iron ore smelters in Pennsylvania, and Missouri, for reducing their ores—the hardest in the world—to a proper size for smelting. These machines are constructed of different sizes. One which will crush, say one and a-half tons of quartz per hour, will weigh, with frame all complete for running, about 6000 lbs.—the castings alone will weigh 4000, and will require a six-horse power to drive it. Machines are made of five graduating sizes up to twice the capacity of the one above described which is the smallest made. The machine is so constructed that it can be driven by any power less than that required for its full working, down to two-horse power, the product of the machine, being simply reduced in like proportion. One of these machines may be seen in almost constant operation at the foot of Market St., in this city.

We fully agree, with the correspondent above alluded to, in his opinion of the "Keith Process." This correspondent, by the way, is evidently one of eminent practical and scientific attainments, in every department of mining. He has been for some months writing a series of very valuable metallurgical articles for the Washoe Times, under the signature of "J. B. TRUCKEE." We quote the conclusion of his letter, already referred to:—

"I should certainly feel much obliged for more information on the subject of Mr. Keith's simple crushing mill for pulverizing the ore, as I have no doubt that it is a vast improvement upon the ponderous stamping process, of which I am no admirer, for I prefer the crushing mill. Mr. Keith's method appears to be more efficacious, as well as more expeditious in its work, for it appears to reduce the ores to the finest powder without the aid of sieves, which are required in the ordinary crushing mill. His invention requires to be well thought upon by all parties interested in the reduction of the ores of this country, as, if it can perform what is stated of it, a vast amount of power of reduction will be attained by every mill throughout the Territory; and the same amount of propulsion used in a stamping mill would most certainly produce nearly double the results and, if the ore is turned out in the state described, it is in a much better condition for giving forth its contents than nine out of ten mills are capable of reducing it to. It must be clear that the extreme rotative momentum of the fan in the drum must be next to irresistible by any substance coming in contact therewith."

Mono County was organized a little more than one year ago. It is a long, narrow strip, extending in length from Walker's River to the 37th parallel South, a distance of about 150 miles. In breadth it extends from 20 to 60 miles. Mono Lake is in the center, and Owen River waters a considerable part of the central and southern portions.

DEATH OF AN EDITOR.—DAVID WENTWORTH, Editor of the Oroville Union, died on the 27th ult., of congestion of the brain, aged 34 years. Mr. W. came to this State in 1860; has resided in Oroville since August last, at which time he engaged in the publication of the Union. He leaves a wife and child in the East. He was a relative of Mrs. SUGOURNEY, the Poetess.

REMOVING SCALE FROM BOILERS.

A series of important experiments have recently been carried out at Portsmouth on board Her Majesty's paddle-steamer Wallace, under the supervision of Mr. G. Murdock, Inspector of machinery afloat at that port. The object sought to be attained, is the removal of the scale generated on the surface of steam boilers and their tubes, by other and more expeditious means than by the present system of manual labor. The importance of the subject will be fully comprehended by all who may be in the slightest degree conversant with steam machinery. Under the present system, to clean a ship's boiler requires cleaning out, or cleaning from aloft, while on board the ship, all the boiler doors have to be taken off and a number of men sent into the boilers to remove the scale by manual labor. By these means, with the greatest exertions and any amount of time, possibly 10 per cent. of the scale might be removed, and with this small improvement the engineer well knows the relief he finds in getting steam. By the system which has now been undergoing so long a series of tests on board the Wallace, only the door of the boiler has to be taken off to allow the introduction of the steam pipe. The boiler to be acted upon, is then filled rapidly with superheated steam at a temperature of 400° of heat; this acting upon the saline deposits on the surface of the tubes, and other parts of the boiler, expands and disengages it from the several parts. After this the boiler is again filled with water, and steam got up in the usual manner, and kept up for a few hours, and on afterwards blowing off the boilers, they are found to be as free from scale as when they were first put on board the ship. The experiments have been highly successful. The saving of fuel alone in our steam ships of war from adapting this plan to their boilers, will be very considerable, and the scale may be removed from a ship's boilers in 12 hours. A very remarkable specimen of scale may be seen in the chemical laboratory in Portsmouth Dockyard, which was removed from the boilers of Her Majesty's ship Sidon, then under the command of Sir Charles Napier. The impression of the tubes on the scale is perfect.

**BALANCE ROLLING BRIDGES.**—Messrs. Turner and Gibson, of the Hammersmith Works, Dublin, have invented balance rolling bridges, of a very simple and convenient construction, which are easily worked and especially adapted for crossing dock entrances, canals, &c. The bridges have also been erected, and found to answer admirably for ordinary traffic and railroads.

**AMERICAN SILVER IN CANADA.**—A letter from Toronto, Canada, says that it is estimated that there are 30 tons of American silver in circulation, or rather hoarded up, in Toronto, London and Hamilton. Merchants take it only at 5 per cent discount.

TO MINERS AND PROSPECTORS.

In view of the frequent accidental discoveries of valuable mineral deposits, other than gold, in almost every section of the State, which have of late been made, it is but reasonable to suppose that prospecting even in California, has but just commenced. The simplest and most universal of all mineraliferous deposits is gold. It rarely occurs in any other form than that of "free gold" which is readily discernable to the naked eye. An examination of any rock or earth for gold is an extremely simple process. If its presence is suspected in alluvium, the simple washing of that alluvium in a pan is an invariable test. If in rock of any description; the rock pounded fine in a mortar and washed, in the same manner as alluvium, will usually expose its gold to the naked eye, if there is any there in paying quantity. The only exceptions, are where the gold is contained in iron pyrites, or copper pyrites containing also iron. In either of the latter cases the presence of gold may be readily ascertained by placing the pyrites in any suitable vessel and heating the contents at a moderate heat for from four to six hours, with frequent stirrings, by which means the sulphur will be evaporated, and the copper, if any is present, changed to a dull red color, and the gold retaining its natural appearance, on subjecting the whole to the usual panning process, may be readily seen by the naked eye.

Not so with other metals. Silver, copper, zinc, nickel,

and many others appear in such a great variety of metalliferous forms as generally to defy all but the most practical and scientific eye. No description of these ores can be written which will afford any very important aid to the inexperienced in making explorations. After reading descriptions, however, and carefully examining the specimens described, the explorer may go out and search with some degree of confidence and intelligence. A study of the characteristics of the sulphureted ores alone, would lead an explorer to pass over, entirely unnoticed, the richest varieties of the ores known as Chlorides or Horn Silver, which, from the facility with which they may be worked, and their usual richness, are generally considered the most valuable of silver ores. There is much reason to believe that this variety of silver ore will be extensively found in all the volcanic regions of this State. So with many other ores.

Considering the great difficulty, in the present lack of cabinet collections, and other means of instruction, to acquire a practical mineralogical and geological education in this State, and desirous to aid, to our fullest capacity, the development of our mineral resources, we hereby make the offer to miners, prospectors and all others, who in their travels or explorations may come across specimens having the appearance of rarity or value, to carefully examine and pronounce upon the same, free of charge, as to their characteristics, value, etc., whenever any such specimens are brought or sent to this office free of cost to us. We have already been called upon in many such cases, and we shall at all times be willing to give our attention to any such requests which may be presented to us.

In carrying out the plan we propose, every miner and prospector should be at all times on the lookout for any new mineral. The ordinary rocks with which the miner meets in his travels and labor, and which possess no mineral value are usually well known. Whenever a rock presents any unusual appearance in conformation, color or other characteristic, attention should at once be given to it. There is scarcely a piece of quartz or rock of a quartzose nature, which presents any uncommon appearance in texture or color that has not been thus modified by the deposit or intrusion of some mineral substance. If such rock is found upon or near a vein of quartz it should be carefully examined "in place," and if the cause of its peculiarity is not evident and readily seen, it should not be passed carelessly by. There may be value in it, although the gold may not shine there. We shall commence in our next issue a series of articles describing as accurately and as intelligibly as possible all the ordinary mineral substances which may be likely to come under the notice of the California prospector. These articles will be published under the head of "THE MINER'S LABORATORY," and will be found of great value to the mining public. [*Mining and Scientific Press, April 20.*]

**SUBSCRIBE.**—Are you a miner and not a subscriber to the MINING AND SCIENTIFIC PRESS? If so, you are an annual loser of many times the price of a year's subscription, particularly if you are engaged in quartz mining. The same amount of practical information, important to miners and mechanics, which is contained in a volume of the PRESS, cannot be bought from the shelves of any bookstore in the country for the price of several year's subscription. Do you ever send a paper to the "Old Folks at Home?" If so, and you desire to send important information and valuable reading matter, you can find no paper that will be read with so much eagerness by them, or one that will convey to them so full an account of the real industry of the country as the MINING AND SCIENTIFIC PRESS. We invite all to send us their names and four dollars, or two dollars for six months, and become patrons of the only mining paper printed on the Pacific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examination, and with the hope that it may so far meet with their approval as to warrant their subscribing for it at once. It is not our usual custom to receive a subscriber for less than six months; but inasmuch as we are anxious to introduce the paper where it is not now known, we will, for the present, send the PRESS for three months even, on the receipt of one dollar, in coin or stamps. It is our belief that no one will wish to discontinue the paper after being a constant reader of it for even that short period.

Mining and Scientific Press

The MINING AND SCIENTIFIC PRESS is published at the Exchange Building, Room 27, corner of Battery and Washington streets San Francisco, Cal. at FIFTY CENTS per month, or \$4 per annum, in advance.

C. W. M. SMITH and W. B. EWER, - - - - - Proprietors

Engravings, Electrotypes, etc.

We execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEREOGRAPHY AND ELECTROTYPING. Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Mills, Seals for Plain or Colored Printing. Job Work executed with dispatch at low rates. Patrons will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

To Printers.

AN INTEREST in one of the most flourishing and best paying Newspaper Offices in the mountains is offered for sale on easy terms. A rare opportunity is hereby presented to any printer desirous of establishing himself in a good business in one of the healthiest, most thriving and delightful mountain towns in the state. For further information enquire at this office.

MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

THIRD YEAR: VOLUME VI.—NEW SERIES!

A new volume of this extensively circulated paper commenced Sept. 11, 1862. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

The paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

**To Chemists, Architects, Millwrights and Farmers!** This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

Terms.

To mail subscribers:—Four Dollars per annum.

Club Rates.

Five Copies for Six Months, \$8.  
Ten Copies for Six Months, \$16.  
Ten Copies for Twelve Months, \$30.  
Fifteen Copies for Twelve Months, \$44.  
Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 80 Names can be sent in at different times and from different Post-offices Specimen copies will be sent gratis to any part of the country.

EWER & SMITH, Publishers,

Room 27, (formerly) U. S. Court Building, Corner of Washington and Battery streets, San Francisco.

Our Mint, its Rules, Charges and Operations.

For parting silver from gold when gold

is below 300-1000ths. fine ..... 3cts per oz.  
" from 30-100ths. to 750-1000ths fine. 7 cts " " oz.  
" " 750-1000ths to 950-1000ths " 14 cts " "

DEPOSITS SILVER BULLION—PURCHASER.

\$1.21 per standard ounce 1/2 per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300 3cts. per oz. gross weight  
301 " 500, 7cts, " " "

DEPOSITS FOR FINE BARS

\$1 16-4-11ths cents. per standard ounce, 1/2 per ct. gross value of silver for making bars; also when gold is contained 1/2 per ct. on gross value of gold for coining. Refining charges as in purchases.

BARs SOLD FROM REFINERY.

\$1 21cts. per standard oz. 1/2 per ct. gross value to be added for making bars.

DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz. 1/2 per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz. 1/2 per ct. gross value of deposit for making bars.

## SUPPORT YOUR MINING PAPER.

THE MINING AND SCIENTIFIC PRESS is the only mining paper in California, and the only medium through which our miners can derive, to any extent, that practical information in relation to their difficult and hazardous calling, which is so essential to an intelligent and successful prosecution of their business. Small as is the modicum of information we have yet been able to give, we have frequently had the satisfaction of personal assurance from our mining readers, that they have often been benefitted by one or two numbers only, more than they could possibly have been by a full year's subscription expended in the purchase of any book or books in the State. We intend to embody in the papers under the head of "Miners' Laboratory," all the published information valuable to miners, and all that can be obtained orally or in manuscript, from such intelligent miners and mining writers with whom we may meet or correspond. Of course, we do not expect to exhaust the subject in one, two, three or four years. Mining, like all other industrial callings, is progressive, and almost every day is developing new facts, in some quarter, which it is desirable should be laid at once before the mining public. This office it is our aim to perform, in addition to collecting and placing before them all standard information. The present is most emphatically an age of progress, and no one can hope to excel or succeed even, in any occupation, without being kept constantly posted in the current improvements in relation thereto.

California, is now upon the mere threshold of mining. Our labors, thus far have been like mere pin scratches upon a school boy's globe.

In years to come, and in few years and short, compared to mining progress in other parts of the world, we shall be burrowing deep, thousands of fathoms deep, into the bowels of the earth. Then other knowledge than that relating to mere surface workings and surface indications will be needed. So long as we continue to manage this paper, we shall endeavor to time our articles devoted to mining instruction, to the most urgent necessities for the time being. We are now in the midst of a "Copper Excitement," and for the past few weeks we have been endeavoring to throw out a few practical hints which shall be most advantageous to our copper hunters. If any think we have failed to give important information on this point, let them invest \$50 in the most judicious manner possible, for books treating upon this subject, and see how much information they will get for their \$50, on the ground which we have traveled over, over and above what we have given them for one dollar in the MINING PRESS.

We shall for the present drop the "mineralogy of copper," and devote a few numbers to the various processes of separation and concentration which the ores of copper require, to prepare them for a market or for the furnace.

We shall take up SILVER, after we have done with COPPER, as our next and perhaps most important subject for examination.

As we stated in the outset, the MINING AND SCIENTIFIC PRESS, is the only paper in California, and in fact, on the Continent, which is especially devoted to the mining interest—particularly with the view of collecting, collating and imparting valuable information to the working miner. Other papers of our City and State devote a liberal share of their columns to general, local and topographical information with reference to the mines, and to some extent keep up a record of their progressive advancement. That class of information, however, is valuable only to the general reader, or to the miner, so far as it may aid him in selling his stocks; but it is of no possible advantage to the working miner, as an aid in the difficult and, to most in this State, untried calling of developing our mines or seeking out new ones.

True, we are devoting but a small space to this class of information, from the fact that in a journal of this kind it is necessary to give variety to its columns; but with an enlarged sheet, such as we propose, we shall be able to do full justice to this important development. As yet we have been able to issue a sheet of only very moderate proportions. But we commenced with nothing, and worse than nothing, as we have been compelled to overcome a most deep seated antipathy against our predecessor, which has cost us far more labor and money than an entirely new enterprise would have done. This antipathy, we believe, has

been pretty much overcome, and we have good reasons for thinking that all who are now doing business with this office are perfectly satisfied with the manner in which our business is transacted.

Our enterprise, commencing as we have already said from nothing or worse, has gradually advanced until it is now self sustaining—at least upon its present basis. But still we are not satisfied. We wish to double the size of our sheet, and treble the amount of reading matter. With such a paper we feel confident that we could be of vast service to the mining interest of the Pacific Coast, and, by the information which we could collect and disseminate, add largely to the general advancement and prosperity of the entire mining interest, to say nothing of the character, and additional importance which such a sheet would give to our great leading interest abroad. But printers will not work for nothing, and paper dealers, at the present time especially, come in for a large percentage of newspaper receipts.

True, our patronage is increasing weekly and daily. Subscribers are coming in from all parts of the State as well as from the city. Advertisers are also beginning to find that the MINING PRESS is a valuable medium for introducing them to the public—especially those transacting business with the mines or who are engaged in mechanical pursuits, and we take this opportunity to thank our friends, who have interested themselves in our behalf, for their efforts.

Perhaps we ought to be content to creep a while longer, but we much prefer to be taking manly strides, and to occupy a position commensurate with the interest which we represent. This we might very soon accomplish, and double the size and usefulness of our sheet, if those in this City directly engaged in mining operations, would bestow upon us but a moiety of that patronage belonging to us, but which is now scattered in various directions and given to those journals whose only tendency in the direction of mining, is to foist upon the public, speculative operations, without imparting any practical information which shall be of value in the actual development of our mines. Our city circulation has now reached an extent and character, which renders our columns a desirable and appropriate medium for "mining notices" of every description—particularly notices of meetings, sales of stocks, &c. Weekly insertions of such notices, as a general rule, are all that are requisite or of any benefit to the Companies. And the fee for such notices, if concentrated in our columns, would enable us to accomplish the desirable object of increasing our sheet from eight to sixteen pages, and so improving the paper as to give it a still wider circulation, and thus return to the companies, by its general usefulness to the mining interest, four fold value for the patronage which they are asked to bestow to enable us to accomplish the end desired. We throw out these hints for what they are worth. The mining public can judge from what we have done to make a mining paper, what might be accomplished under more favorable auspices. The need of a first class mining paper all admit. There is ample business in this city to support it if it can be concentrated. It will cost the mining interest nothing beyond what they now pay—nay, less than they are now paying, to establish and sustain such a paper. Will they do it?

A MOST ELEGANTLY FINISHED and ingenious piece of mechanism may be seen at the Machine Shop of MR. DAVID STODDART, at the corner of Pine and Front Streets, the same being a patent Injector, recently purchased by the Gould & Curry Co., for supplying the steam boiler of their mill with water.

This instrument is one of the most ingenious devices which the inventive genius of the age has produced. It has been pronounced, by the most eminent French Engineers, when used as a feed-pump for steam boilers, as absolutely perfect in theory, and the best, most reliable and safest apparatus which has ever been invented for that purpose. The Academy of Sciences, of Paris, have awarded the inventor what is known as the Montyon prize of 1000 francs, for having produced "the most deserving invention of instruments useful to agriculture, the mechanic arts, or science," for the year.

The invention was first introduced some four or five years since, and is fast coming into general use all over the world. The California Steam Navigation Co. have them upon eight of their boats; there are six in use at the Mare Is-

land Navy Yard. They are now being introduced into the mines of this State. The one above alluded to, designed to be put up at the Gould & Curry Mill at Washoe, is well worth the attention of mechanics, as well for the beauty and style of its finish as for the intrinsic merits of the invention. Mr. STODDART is agent for the sale of these machines on the Pacific Coast.

## THE MINING STOCK MARKET.

No material change has occurred in the Mining Stock Market during the week. The same discrimination noted for a few weeks past still continues to govern operations. A few stocks of accepted value have advanced during the past six days, while some shares of real merit have receded, through mere neglect, on the part of buyers. Stocks, especially in a fluctuating market, seldom remain firm at any figure, for any considerable length of time, without demand. This is particularly the case in speculative stocks, or those whose value is based chiefly upon prospective developments.

Gould & Curry is still advancing and holders are more confident than ever, of the large dividends in future. The closing bid for these shares on Saturday was \$5,100, with \$5,200 asked. The advance during the week has been \$700.

Ophir is still declining. We quote today at \$2,150. The continuance of low dividends, and large anticipated disbursements for additional mill facilities, etc., are bringing into the market the shares of irresolute holders, and a decline is a natural consequence, notwithstanding the firmness manifested by large stockholders.

The New Almaden Quicksilver Mine, according to the *Mercuriale Gazette*, is in active operation, the yield being abundant, and everything progressing quietly in the usual routine. The shipments of Quicksilver from this port, chiefly the product of this mine since the 1st of January last have amounted to 17,182 flasks (of 75 lbs. each) against 13,500 flasks for the same period of last year.

Savage has further advanced and may be quoted at \$2750. It is expected that the first dividend of this Company will be paid the first of August.

Chollar.—The directors of this Company levied another assessment of \$72 per foot on Saturday last. The Stock has been in considerable demand the past week, at an advance, but a decline may be looked for this week in consequence of the new assessment.

Potosi has attracted much attention. On Wednesday some of the large holders threw their Stock on the Market at \$400 @ \$450, with considerable sales, causing a panic amongst those who had been anxious to purchase early in the week at \$500 @ \$550. At the close \$450 was offered for small lots.

Daney has been in demand during the week at \$390. The dividend for June on 200 shares has been sold for \$13½ per foot. One lot has been sold as high as \$15. Sanguine holders are expecting \$20.

Burning Moscow has been considerably dealt in, the past week, mostly on time. Much anxiety is felt by holders with regard to the issue of the Ophir injunction.

Yellow Jacket is greatly in favor, and closes firmly at \$925.

Overman may be quoted at \$200.

Wide West commenced at \$205, and closed at \$215, with a strong market.

Silver Hill sold as low as \$34.

Real del Monte, \$140; Utah opened at \$60, and closed firm at \$70; Bamboo, but little dealt in at \$55 to 60; Pont dropped to \$20, with considerable sales; Sunbeam, \$7 Rhodes Diggings, occasionally bought at \$35 to \$40. Jo sebbine, a declining market, last sold at \$13 50. Willow Springs, 6 50 to \$8. Union, (R. D.) \$2 25 to \$2 50. Sheba, has a dull market, closing at \$410. Melones, advanced to \$115. Sacramento and El Dorado, sold at \$70, without any feature.

Lucerne is inquired for at \$18 to \$19.

Lady Bryan has a market at \$7 to \$7 50.

St. Louis has been largely operated in at small prices.

Mt. Davidson is more in demand, and has reached \$5.

## THE COPPER INTEREST.

The Copper Interest is fast assuming a leading importance throughout the State. The shipments of Copper Ore from the interior are constantly increasing, while buyers of the ore from both home and foreign markets, are multiplying in this City. Capitalists have now become fully alive to the importance of this new interest and the steady advance of stock in reliable mines, is a sure index of the confidence felt in their value and permanence. Copper mines, in all parts of the world, have ever proved the most reliable and uniform in yield, of any of the precious metals, and the practiced eye of numerous experts from Cornwall and other copper mining regions, recognize, here, the same unmistakable evidence of permanence and uniformity which characterize the mines of this metal elsewhere.

In addition to this most encouraging evidence, we have also the admitted fact that the mines of California, as a whole, so far as developed, far exceed in richness those of any country, unless, perhaps, we may except those of Lake Superior. Hence it is not at all a matter of astonishment, that public attention should be so strongly inclined in this direction, or that the Copper future should even exceed the silver mania on Montgomery st. at high noon of cheerful day.

From the Mines of Calaveras County we continue to hear the most cheering accounts. The product of the mines of that region is constantly increasing in quantity and improving in quality. Stock in the Union Mine is estimated as high as \$1,000 per foot with none offering.

The Keystone, adjoining the Union may be quoted at \$150 per foot, with but little offering. This mine has a large force employed. Concentrating machinery is now being put in operation in connection with this mine.

The Napoleon may be quoted at \$150 with \$250 asked. The vein of ore in this mine is rapidly improving.

The Josephine, an extension of the Napoleon is offered at \$35 @ \$40 per foot. We are not informed of the progress of the work upon this mine, although we believe considerable is being done.

The Newton, in Amador County, is still raising and forwarding very rich ore. The mine promises well. We are not aware that there is any of its stock in the market.

The Copper Mill Company is in the same vicinity, and is also coming into notice, although they have no stock in the market. The Company is shipping ore.

In the Campo Seco mine, Calaveras County, 1225 feet changed hands a few days since for \$24,750—a fraction over \$20 per foot.

We understand that a few of our prominent brokers are about to visit the mines of Calaveras and Amador, to determine for themselves the capability of these mines to pay the dividends predicted by the present owners. We propose a trip in that direction ourselves, as soon as the concentrating machinery now in progress of erection shall be in operation.

From Placer and El Dorado Counties, we hear highly favorable reports. Much activity still exists in these Counties in the search for new, and the development of discovered mines.

Similar reports reach us from Nevada County, although our advices from that quarter are not as full as we wish they were. Our correspondents, in that direction are somewhat remiss in their favors; in consequence, probably, of too much personal interest in feet. We learn that the "Last Chance," of Rough & Ready have filed their certificate of incorporation. This stock is estimated very high. We understand that offers of \$70 @ \$80 per foot fails to loosen the grasp of holders upon their favorite stock. The mine at last accounts showed a 15-foot vein, well defined.

In Butte County rich indications are constantly being found, and prospecting is going on with much spirit.

In Del Norte, the lack of road facilities, and scarcity of experienced laborers is operating quite unfavorably to the development of the mines, although most excellent indications and prospects are everywhere found. These hindrances will soon be obviated. The Mammoth, from that section, exhibits fine ore in this city—So also does the Alta.

At the Mount Diablo mines work is being vigorously prosecuted with encouraging prospects, but, so far as we have been able to learn, with no important results up to the present time.

## GENERAL MINING STOCK REPORT.

## REPORT OF BIDS

At the San Francisco Mining Stock Board,

For the week ending June 13, 1863.

## REMARKS

The "Crockett" Ledge, on Last Chance Hill and the "Cincinnati" on Silver Hill have, the past few days, caused considerable excitement in this district by the development of unusually rich ore. The Crockett is down to a depth of about 60 feet, and the Ledge is over 5 feet wide.

About 100 tons of rock has been hauled to the mills, preparatory to crushing, which it is believed will yield over \$200 to the ton.

The Cincinnati has also a large amount of rock out at the shaft which is believed to be equally rich.

**THEATRICAL.**—We have for some time contemplated supplying our numerous readers in the country, with short theatrical criticisms, so that, on visiting the city, they may know where to find the best entertainment. This week, however, we have to confine ourselves to the Eureka, where the San Francisco Minstrels nightly hold forth. Since the Eureka opened with this troupe, it has been well patronized by large audiences of both sexes, and it is well understood now, that the most fastidious need not fear meeting with anything vulgar in the performances. The singing is of the first-class character, with the solitary exception, perhaps, of a little too much instrumental accompaniment. Birch and Cotton this week, in the "Black Statue," "Virginia Mummy," and "Scenes in the Police Court," have been very happy. Let those given to fits of despondency take a dose of their drollery, and we vouch for a better frame of mind. Those, loving good music, and a good laugh, are unjust to themselves, and these popular actors, if they omit visiting the Eureka.

## POST-OFFICE COMPLAINTS.

We hear frequent complaints from subscribers in various quarters, with regard to the non reception of papers, and have found it impossible, in several places to extend our circulation, for the only reason that the "Press" can not be obtained regularly from the Post-Office. We know not where the fault is. The paper is regularly mailed at the San Francisco Office, done up in strong wrappers, and carefully directed. Subscribers who fail to receive their papers regularly should first learn from their local Office, whether, when the papers do arrive, they come in good order, or whether the wrappers have been removed, etc., and communicate all the facts to us. We will then endeavor to learn the cause of the irregularity, and so far as possible rectify the same.

-----------------	------------------	-----------	--------------------

Name of Company	Location of Mine ;	Secretary	Locality of Office
-----------------	--------------------	-----------	--------------------

We wish it distinctly understood that all the interests which Julius Silversmith ever had in the MINING AND SCIENTIFIC PRESS, ceased in November of 1862. EWER & SMITH are now the publishers and proprietors.

## DESKS

AND

Office Furniture,

ALL KINDS.....FOR SALE BY

**JOHN WIGMORE,**

No. 423 CALIFORNIA ST., SAN FRANCISCO.

OFFICE JOBING, of all kinds, attended to.

**PALMER, HANSCOM & CO.,**

**GOLDEN STATE IRON WORKS,**

No. 19, First Street, San Francisco,

urnish Castings and Machinery of all kinds

ALSO:

GENUINE WHITE IRON SHOES AND DIES.

PALMER, HANSCOMB & CO.

F. E. WEYGANT.

**Volcanic Smelting Furnace.**

PERSONS DESIRING INFORMATION AS TO THE USE and economical properties of this Furnace, and intending to make use of the same, when satisfied of its superiority over all other means of reducing ores and separating metals from the sulphurets, can obtain all needed explanation and advice in regard to the same, and the terms of sale of rights to use the same, on application Col. J. D. Stevenson or T. Ogg Shaw, or by letter to the proprietress through the Post Office of San Francisco. Drawings may be seen at the office of Col. J. D. Stevenson, No. 614 Merchant street, or at the office of T. Ogg Shaw, in Brannan's Building, Montgomery street.

The time required for reducing ores by this Furnace is from three to eight hours, and the amount of fuel only one-tenth as much as is consumed by other processes.

The process of condensation is applied to this Furnace which will save all those portions of precious metals which usually escape in a volatile form.

The attention of all interested in the subject is requested to examine the important results obtained by this process.

Parties wishing will be allowed to erect a trial Furnace of a capacity for smelting from one or more tons, on signing an obligation to pay the usual fee for the right to use it, should they continue to make use of the invention or a longer period than two months.

mch 16 MRS. E. J. HALL, M. D., Proprietress.

**LEANDER RANSOM,**

**Civil Engineer**

AND

**SURVEYOR,**

Having been connected with the public works of the State of Ohio for 20 years, and the public surveys of the State of California for 7 years.

at the San Francisco Bay District Agricultural Fair, 1862

MANUFACTORY, WHOLESALE AND RETAIL,

No. 44 Leidsdorff street,

Opposite the What Cheer House, San Francisco.

**To Mine Owners.**

**PARTIES having a Good silver Mine** and wishing for

Machinery to work it for an interest in the Mine will do well to apply at this office. No organized company need apply.

**50 lbs. MARINE and**

**Fire-Proof Paint,**

**MANUFACTURED BY THE PACIFIC METALLURGICAL Works in this city, for Hulls and Decks of Vessels, from ground Mineral Rock contains Arsenic, Copper, Litharge and six other Minerals. When used on the Decks or Bottoms of Ships, it is equal to a coat of Stone, and quite equal to Copper, no worms will ever effect it, and cheaper than any other paint.**

**DIRECTIONS:**

For Decks of Ships, use two parts Mineral Paint, one part White Lead, mix with Linseed Oil.

For Bottoms of Vessels, use one part ground sulphur three parts Mineral Paint, mix with Coal Tar and apply it hot.

For sale by all Ship Chandlers and Trademen, in boxes of 50 lbs. each, or by the Pacific Metallurgical Works.

**25 POUNDS FIRE-PROOF PAINT.**

When used on Roofs, Buildings, or Fences, it is equal to covering them with a coat of Stone, being perfectly Fire Proof, and costing less than any paint.

**DIRECTIONS:**

HOUSE:—Mix three parts Mineral Paint with one part white lead, thin with Linseed oil: if a lighter color is wanted, mix less paint, more lead.

ROOF:—Five parts of Mineral Paint, one part white Lead; mix with Linseed oil. Put it thick on a tin Roof as one coat when properly applied will last three years.

S. C. BRADSHAW, Agt.,

**WORKS, North Beach; Office, 318 California st., San Francisco.**

**WRIGHT'S PICKS.**

**JOHN WRIGHT,** of Sacramento, has established himself in San Francisco for the manufacture of every description of PICKS, of the best material, at reduced prices. SAN FRANCISCO.

## SPECIAL NOTICES.

**Office of the Ophir Silver Mining Co.**  
San Francisco, June 6, 1863.—A dividend on the capital stock of this Company has been declared, payable on and after the 9th instant.

The Transfer Book will be closed until the 9th inst.  
THOMAS J. LAMB, Secretary.

**Office of the Table Mountain Copper Co.**  
An assessment of Twenty-five cents per share was this day levied upon the capital stock of this Company, payable immediately, in gold coin of the United States, to the Secretary, at the office of the company, No. 523, Montgomery street.

M. G. ELMORE, Secretary.  
San Francisco, May 18, 1863.

**The Annual Meeting of the Stockholders** of the Table Mountain Copper Company will be held at the Office of the company, No. 523 Montgomery street on the second Monday in June next, at 7 P. M.  
M. G. ELMORE, Secretary.  
San Francisco, May 18, 1863.

**Office of the Nevada Copper Mining Co.**  
March 24, 1863.—At a meeting of the Board of Trustees, held this day, an assessment of Forty cents per share was levied upon the Capital Stock of the Company, payable in twenty (20) cents per share within thirty days, and twenty (20) cents per share within sixty days from this date, to the Secretary. By order of the Trustees,  
J. ARMSTRONG, Secretary.

**Office of the Tennessee Gold and Silver Mining Company.** No. 7, Montgomery Block.—At a meeting of the Board of Trustees held April 22, 1863, an Assessment of One Dollar and Fifty cts per share upon the capital stock of said Company was levied, payable on or before Saturday, the 23d day of May, 1863.  
J. H. BLOOD, Secretary.  
San Francisco, April 27, 1863. (tma21)

**J. F. & H. H. SCHAFER**  
Manufacturers of and Dealers in  
**BEDDING and FURNITURE,**  
of every description,  
Blankets, Comforters, Sheets, Etc., Etc.  
Nos. 504 and 506 Sansome Street,  
(Near Clay.) San Francisco.

This Establishment is now generally known to be the Cheapest Place in the City for good Bedding.  
Branch Store.....Broad St., Nevada.

## WHEELER'S Amalgamating and Separating Pans.

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of triturating, and in cleaning up. By the introduction of the Separating Pan to follow the triturating this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated on the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors as well as a still larger percentage in the amount of work performed.

\* \* \* These Pans may be seen in daily operation at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves.  
2016-1f ZENAS WHEELER.

**PEOPLE'S  
Steamship Line!**  
connecting California and New York  
VIA NICARAGUA.

750 Miles Shorter than any other Route!

The Fast and Favorite Double Engine Steamship,  
**MOSES TAYLOR,**  
J. H. BLETHEN.....COMMANDER  
Will be dispatched for  
**SAN JUAN DEL SUR,**  
From Mission street Wharf,  
**WEDNESDAY, - - - June 10, 1863.**

Punctually at 9 o'clock, A. M., on  
Connecting at GREYTOWN with the Splendid Steamship  
**AMERICA - - - - - 2500 Tons.**

Reduced rates of Passage and quick trips are secured by the re-opening of the Nicaragua Route.  
These Steamers are unsurpassed for speed, cleanliness and safety, and every effort will be made to insure the comfort of passengers.

For further information apply to

## The Pacific Mineral Company

**MAKE LIBERAL ADVANCES UPON THE ORES OF  
COPPER, SILVER, TIN, NICKEL, COBALT, ZINC,  
LEAD, AND SULPHURETS CONTAINING GOLD.**

Due account taken of all valuable metals combined with Silver and Copper Ores, and advances made therefor.

Parties owning undeveloped mines and desiring capital to prospect the same will receive assistance, if, upon examination, such leads are deemed sufficiently valuable to justify such expenditure.

OFFICE, No. 1, OLD FELLOWS' HALL,  
je1-1f Montgomery Street, San Francisco.

## MARTIN &amp; Co.,

OFFICE--224 Montgomery Street, Up Stairs,

WILL CONTRACT FOR THE

## Purchase of Copper Ores,

Assaying 8 per cent and upwards of Copper to the Ton. We will make ADVANCES upon Ores of COPPER, TIN and NICKEL.

Sacks will be furnished and Freight Paid on all consignments if desired by the consignors.

HENRY MARTIN, J. F. GREENMAN,  
New York. San Francisco,  
San Francisco Post Office, Box 1259.  
je 1.

## REYNOLDS' Patent Cut-Off and Governor, FOR STEAM ENGINES.

137 of these Invaluable Machines,

ARE NOW IN USE

In California and Nevada Territory, giving a perfectly regular motion and

Saving 20 to 65 per cent of the Fuel.

## Steen's Improved Governor

Is the CHEAPEST, SIMPLEST and QUICKEST to act and least liable to get out of order of any Governor in use. It can be seen in operation at the Golden State Iron Works, and at the Stone Breaker, foot of Market Street, San Francisco.

## Clark's Steam and Fire Regulator,

For controlling the Draft or Blast by opening the Chimney or Valve in the Blast Pipe by the pressure of the steam in the boiler. It will regulate the pressure to a pound, on the square inch. It cannot get out of order and any person can put one up in an hour after the damper is put in.

## Ingersolls Patent Drill Press,

With which drilling can be done the same as with the common ratchet, and when small holes are wanted, it can be done four times as fast. The handle can be worked in any direction.

## Felt for Steam Boilers, Pipes, Etc.

At the lowest market rates.

## Steam Engines, Boilers, Pipes,

Hydraulic Presses, Shafting, Pulleys, Etc., at the lowest market rates.

## Anti Incrustation Powder,

A Sure Remedy for Scale in Steam Boilers, without injury to the iron. In use for the past EIGHT years.  
Refer to—Sugar Refinery, San Francisco,  
Cottell & Co., San Jose,  
L. A. Booth, Esq., Virginia City,  
and 2,000 others in the United States.

E. T. STEEN AGENT.  
No. 33 Fremont Street, San Francisco.

## Percy Douglas,

IMPORTER OF

## CROCKERY, FRENCH CHINA,

Glass Ware, Etc., Etc.

No. 421, MONTGOMERY STREET.  
SAN FRANCISCO.

## A. C. MORSE,

Mining and Real Estate Agent,

OFFICE—S. W. corner Pine and Silver sts., Aurora.

**HAVING MADE ARRANGEMENTS** with MINER S. MARTIN ESQ., one of the principal Stock Brokers of San Francisco. I am prepared to BUY and SELL every description of Mining Stocks in Esmeralda District

**MYERS & DAGGETT'S  
Mining and Stock Exchange,**  
No. 23½ B Street, Virginia City, N. T.

*Mining Stocks of All Kinds Bought & Sold.*

Business connected with Mining Stocks of every description promptly and confidentially attended to.

\* \* Abstracts of Titles Furnished, Etc.

## Pacific Mail Steamship Company.

## NOTICE.

**ARRANGEMENTS HAVE BEEN MADE** by which shipments of

Gold, Silver and Copper Ores

can be forwarded under through Bills of Lading from San Francisco to England, at reasonable rates. For further particulars apply to

A. B. FORBES, Agent,

28-1f Corner Sacramento and Leidesdorff streets.

## P. M. STEAMSHIP COMPANY.

## NOTICE.

**Until further notice, the Steamers of** Pacific Mail Steamship Company will hereafter be dispatched on the

3d, 13th and 23d of each month.

When any of the above date fall on Sunday, the steamer will be dispatched on the following Monday.  
A. B. FORBES, Agent.

## Wm. P. TAAFFEE,

IMPORTER AND JOBBER OF

Staple and Fancy Dry Goods,

CARPETS, DUCK, ETC.,

Cor. Front and Sacramento streets,

SAN FRANCISCO.

## A. ROMAN &amp; Co.,

WHOLESALE AND RETAIL

## Book Establishment,

417 and 419 Montgomery street,  
SAN FRANCISCO.

Orders respectfully solicited and promptly attended to. A Treatise on Metallurgy, Concerning Mining and General and Particular Metallurgical Operations, Etc. Etc. By Frederick Overman.

A Manual of Metallurgy, or A Practical Treatise on the Chemistry of Metals.

Records of Mining and Metallurgy, or Facts and Memoranda for the Use of the Mine Agent and Smelter.

By James Phillips and John Darlington.

Manual of Metallurgy, more particularly of the precious metals; but including such others as are employed in dental practice.

Pigott on the Chemistry and Mining of Copper.

Practical Mineral Assaying and Mining. Overman.

Gold Mining and Assaying; by Phillips.

Micros' Composition and Guide, compiled by Silversmith.

Assayers' Guide; or Practical directions to Assayers, Miners and Smelters.

Practical Assaying, by Michell.

Silver Ores and Silver Mines, by Pro. Blake.

Ure's Dictionary of Arts, Manufactures and Mines.

Weissbach's Mechanics of Machinery and Engineering.

Neville's Hydraulic Formula Tables.

Fresenius' Chemical Analysis.

**Together with many other works in this and similar lines**

Books imported to order on short notice. -  
A. ROMAN & Co.  
417 & 419 Montgomery Street.

## To Mining Companies.

**FOR SALE**—A STEAM ENGINE AND BOILER. The Engine is 30 horse power—10 inch cylinder—2 inch stroke—solid iron frame, with heater, pump, etc. all complete. The boiler has 5 flues, is 24 ft long, 4 inches in diameter, made up from the best three-eight inch Low Moor Iron, and weighs about 5000 pounds.

Both Engine and Boiler are in perfect order and fully guaranteed. Apply to

I. H. HAM, No. 211 Clay st.  
San Francisco, June 18, 1863.

## New Patent Agency

**WE HAVE CONNECTED WITH THE** Publication of the "Mining and Scientific Press"

## The Patent Agency Business,

And would invite Inventors and Discoverers on the Pacific coast, who wish Dispatch as well as Economy to call upon us. We have an Experienced Agent at Washington, which, together with our own experience of several years, renders the

## Mining and Scientific Press Agency

The most desirable place to make application for Letter Patent on the Pacific coast. Apply at

Office of the "Mining and Scientific Press," Room No. 27, Federal Building, corner of Battery and Washington streets, (directly opposite the Post Office,) San Francisco. EWER & SMITH.

## FOREIGN PATENTS OBTAINED

By application at this office, Room 27, Federal Building. EWER & SMITH, Solicitors.

## NOTICE TO INVENTORS.

Inventors wishing to file Patents should apply at the Office, Room No. 27, Federal Building. Terms moderate. EWER & SMITH.

## PATENT RIGHTS.

**Patent Rights Bought and Sold,**  
At the office of the "Mining and Scientific Press" Agency. EWER & SMITH.

## P. M. S. CO.

**PACIFIC MAIL STEAMSHIP COMPANY** line to PANAMA, connecting via the Panama Railroad with the steamers of the Atlantic and Pacific Steamship Company at Aspinwall.

## FOR PANAMA.

The following Steamships will be dispatched in the month of May, 1863.

June 13th, - - - Steamer Constitution

June 23d, - - - Steamer Orizaba

Will leave Folsom Street Wharf, with Passengers and Treasure, for Panama

AT 9 O'CLOCK, A. M., PUNCTUALLY,

And connect, via Panama Railroad, at Aspinwall, with steamships for New York.

For Freight or passage, apply to

A. B. FORBES, Agent.  
je4 Corner of Sacramento and Leidesdorff sts.

## Miners' Foundry

—AND—

## MACHINE WORKS

First St., between Howard & Folsom,  
SAN FRANCISCO.

**EVERY DESCRIPTION OF IRON AND BRASS** Machinery in Sections, designed for places of difficult access. Various models of Quartz Crushers, Amalgamators and Water Wheels—some in operation and on exhibition.

Steam Engines and Boilers, Flower, Saw and Gun mill machinery, Mining Pumps, Amalgamators, Rotors, Etc., Etc., Etc.

Particular attention will be given to the manufacture of Machinery in Sections, designed for places of difficult access. Various models of Quartz Crushers, Amalgamators and Water Wheels—some in operation and on exhibition. \* \* Parties desiring to test their ores practically, small quantities will be afforded ample facilities, free cost.

All parties desiring accurate and highly finished drawings and Superior Machinery, at most reasonable rates are cordially invited to call before contracting elsewhere.

NO. 34.

## THE MINERS' LABORATORY.—NO. VIII.

HOW MINERS MAY FORM AN APPROXIMATIVE IDEA OF THE PERCENTAGE OF COPPER IN THEIR ORES.

[Miners and others will find the following, which has been furnished us by a skillful chemist, a very simple and reliable method for ascertaining the percentage of copper in their ores. Parties from a distance wishing to provide themselves with this simple apparatus can do so by remitting to us the amount of \$20, free of charge, in return for which we will forward the apparatus by express.]

The following apparatus and chemicals are necessary—Six glass bottles, to hold about 8 ozs. each, the bottle must be flat and wide and the glass very clear; 1 funnel; package of filtering paper; apothecary balance, which will cost about \$5; nitric acid and ammonia, of each a quart, and about one ounce of very thin copper wire.

Weigh out the following quantities of the copper wire, separately:—4 grains, 3 grains, 1 grain,  $\frac{1}{2}$  grain,  $\frac{1}{4}$  grain, dissolve each one by itself, in nitric acid. When dissolved add ammonia until it smells strongly. Transfer the several solutions, each one by itself, into an 8 oz. bottle as before described, and fill up with water; cork tightly.

The bottle containing 4 grains, mark No. 4, the one containing 3, mark No. 3, and so on—each one representing by its number, the number of grains of copper dissolved.

You have now six bottles, each containing a known quantity of copper; the greater the amount of copper the darker the solution is. After doing this, you have a standard solution which will last for years, if properly kept.

When you have an ore to assay, pulverize it very fine, and dissolve 20 grains of it in nitric acid. When the whole has been dissolved add ammonia as above until it smells strongly, filter the solution and wash the residue on the filter, by pouring a little hot water to run through it so as to obtain the whole of the blue solution. Transfer now, your blue ammoniacal solution into an 8 oz bottle. If you have not sufficient of the blue solution to fill it up, do so by adding water. When this is done, compare the colored solution so obtained, with the four standards, which we have already described. If it is as dark as the one labeled No. 4, it is plain that you have 4 grains of copper in your bottle, and that is the quantity of copper in 20 grains of the ore—therefore your ore contains 4 multiplied by 5=20 per cent., of copper. If the solution you have obtained from the ore is not so dark as that of No. 4, compare it with No. 3; if it corresponds, then 20 grains of the ore contain 3 grains of copper, or, 5 multiplied by 3=15 per cent of copper. If it be of the same color as any of the others, proceed in the same manner. But if you find that it is darker than No. 4, pour it into a tumbler, and mix it with an equal quantity of water; shake it up well, fill your bottle with this reduced solution and compare it with No. 4. If it be as dark, then you have twice 4, or 8 grains of copper in 20 grains of ore, which is equal to 40 per cent of copper. If it be of a lighter color than No. 4, compare it with No. 3; should it compare, then you have twice three, or 6 grs. in 20 grains of ore, which is equal to 30 per cent of copper.

If you find that your solution from 20 grains of ore be only of the same color as the ore marked, No.  $\frac{1}{4}$ , 20 grains of your ore contains only  $\frac{1}{4}$  of a grain of copper, which is equal to  $1\frac{1}{4}$  per cent of copper.

## GLOSSARY OF MINING AND METALLURGIC TERMS.

For convenient reference, we have prepared the annexed glossary of the technical and provincial terms relating to the science of mining and metallurgy, which includes most of those in use in this country and in books treating of these subjects. The fact that a great number of Cornish and German miners are employed in our mines readily accounts for the introduction of foreign, provincial words, many of which are already in familiar use in the Lake Superior copper region; others are used in foreign works treating of mining and metallurgy, and have been adopted in English books, when we have no word expressing exactly the same idea.

In the glossary, the letter *C*, affixed to a word signifies that it is of Cornish origin; *F*, follows a term adopted from the French, and *G*, from the German language.

### GLOSSARY.

**Abstrich.**—(*G*)—Impure litharge obtained in the operation of separating silver from lead ores.  
**Abzug.**—(*G*)—The first, very impure litharge which is formed in the operation of cupelling argentiferous lead ores.  
**Adit—adit-level.**—A horizontal excavation or gallery through which the mine is drained. The adit-level is usually commenced from the bottom of the lowest neighboring valley, and extended through the workings of the mine.  
**Adventurers.**—Shareholders, or those interested in a joint mining enterprise.  
**Air-machine.**—Apparatus for ventilating a mine by withdrawing the foul air from it, or by forcing in pure air from the surface.  
**Aitch.**—A piece of ground left unworked near a shaft.  
**Attle.**—Rubbish; rock containing too little ore to be worth working.  
**Average standard.**—(*C*)—The price per ton of the fine copper in the ore, after deducting the charge for smelting, which amounts, at Swansea, to 2£ 5s. per ton of ore.  
**Back.**—The back of a lode is that part of it which is nearest the surface in relation to any portion of the workings of the mine; thus the back of the level is that part of the lode which is above.  
**Bar.**—Term applied in Cornwall to a vein of a different description of mineral crossing the lode or country.  
**Beat away.**—To excavate; a term usually applied to hard ground.  
**Bed.**—A seam or horizontal deposit of ore.  
**Bend.**—(*C*)—Indurated clay; term applied by the miner to any hardened, argillaceous substance.  
**Bluck jack.**—(*C*)—Blende, sulphuret of zinc.  
**Blust.**—The air introduced by the blowing apparatus into the furnace.  
**Blower.**—(*C*)—A smelter of ores.  
**Bounds.**—(*C*)—The limits of the ownership of a tract containing tin ore.  
**Brasque.**—(*F*)—A lining of closely-beaten charcoal, or other carbonaceous substance.  
**Branch.**—A small vein which strikes out from the main lode, or branches from it.  
**Brood.**—Impurities mixed with the ores.  
**Broil.**—The traces of the presence of a lode found in the loose matter at or near the surface.  
**Buckers.**—Men who break or bruise the ore.

**Buddling.**—Separating the ores from the mixture of earthy substances by means of a wooden frame of cistern filled with water.

**Bunch.**—A small quantity of ore in a compact mass in the vein.

**Cal.(C).**—Wolfram; tungstate of iron and manganese.

**Cand.**—(*C*)—Fluor-spar.

**Captain.**—Superintendent of a mine.

**Counter (or contra) lode.**—A lode forming an angle with the ordinary direction of the other lodes in its vicinity.

**Champion lode.**—The principal lode of a mine.

**Clack.**—The valve of a pump of any kind.

**Cob.**—To break up the ore with hammers, so as to sort out the valuable portion of it.

**Cockle.**—Schorl, or black tourmaline.

**Coffin.**—Old workings open to the day.

**Comb.**—The arrangement of the mineral contents of the lode in parallel, crystalline masses.

**Cost-book system.**—The method of working a mine according to certain regulations, by which the adventurers may at any time "sign off," and cease to be liable for any further expenditure in proving the mine. The plan is to insert in the "cost-book" the name and address of each of the adventurers who first work the mine, with all the subsequent transfers of shares, and every expense attached to the undertaking; a meeting of the proprietors is held every two months, at which the purser presents his accounts, made up to that period, and the share-holders are thus enabled to judge of the state of the undertaking before incurring any further liabilities.

**Country.**—The strata or rock which the vein traverses; the rock in the neighborhood of the vein.

**Course.**—The direction of the vein.

**Cross course.**—A lode or vein which intersects another at a considerable angle, and which frequently throws the first out of its course.

**Cross-course spar.**—(*C*)—Radiated quartz.

**Cross cut.**—A level driven at right angles with another to intersect the lode.

**Crop.**—The best ore.

**Crop out.**—To come to the surface; referring to strata.

**Crush.**—To grind the ores without water.

**Cut.**—To intersect by driving or sinking.

**Costenning.**—Discovering the situation of a lode by sinking pits in its vicinity, and driving transversely to intersect it.

**Cofering.**—Securing the shaft from the influx of water by ramming clay, &c., around the sides of the timber.

**Dam.**—(*C*)—Choke damp; foul air.

**Dawdling.**—(*G*)—Residue of copper in the process of separating silver from copper in the liquation process.

**Dead-work.**—Work where the vein is not productive, or work which is done without obtaining any ore.

**Deads.**—Rubbish; attle; veinstone barren of ore.

**Dialling.**—Mining engineering; surveying within a mine.

**Dish.**—(*C*)—That portion of the produce of a mine paid as rent to the owner or lord.

**Dissuening.**—Breaking down the strata from one of the walls of a rich and narrow vein, so that it can afterwards be taken down without loss or waste.

**Dropper.**—A branch which leaves the main lode.

**Drowing.**—Excavating in a horizontal direction; opposed to sinking or excavating in a vertical direction.

**Droft.**—Horizontal excavation

**Dress.**—To clean the ore by breaking off fragments of the gangue from the valuable ore.

**Elvans.(C).**—Dikes of granite and feldspar; porphyritic rocks cutting the slates and granites of Cornwall.

**Engine-shaft.**—The shaft by which the water is drawn from the lowest portion of the mine.

**Feeder.**—A branch falling into the main lode.

**Fault.**—A sudden interruption of the continuity of strata.

in the same plane, accompanied by a crack or fissure of a width varying from a mere line to several feet.

*Flucon.*—Decomposed, clayey matter, accompanying the slides and cross-courses, and sometimes the lode itself.

*Foot-wall.*—The wall on the lower side of the lode.

*Gangue.*—The non-metalliferous portion of the lode; the mineral substances accompanying the ore.

*Gad.*—A pointed wedge of a peculiar form, having its sides of a parallel figure.

*Garkupfer.*—(G.)—Refined copper.

*Glist.*—(C.)—Mica.

*Good levels.*—Nearly horizontal levels.

*Gossun.*—Oxide of iron, intermixed with quartz, generally found near the surface, in the lode or accompanying it.

*Grass.*—The surface; the open air.

*Grown.*—(C.)—Decomposed granite.

*Ground.*—The rock which is adjacent to the lode; the strata in which the lode occurs.

*Gulph of ore.*—A very large deposit of ore in the lode.

*Hanging-wall.*—The wall or side above the lode, in contrast-distinction to the foot-wall.

*Heave.*—The horizontal dislocation which occurs when one lode is intersected by another having a different direction.

*Horse.*—The dead ground between two branches of a lode.

*Joggling-table.*—Inclined board, and which is made to move with a sudden and quick motion, used in washing the ores.

*Jig.*—To separate the ore with a riddle wire-bottomed sieve, the heavier substance sinking to the bottom of the sieve.

*Junction.*—Point where two veins, or different rocks, unite.

*Keave.*—A large vat.

*Kibble.*—The bucket in which the ore and attle are sent to the surface.

*Killas.*—(C.)—Clay slate.

*Kupfer-stem.*—(G.)—Regulus from copper-lead ores twice roasted.

*Lander.*—The man who attends at the mouth of the shaft to receive the ores as they are sent to the surface.

*Leader.*—A branch of the main vein.

*Levels.*—Galleries driven on the lode at various depths, generally at intervals of ten fathoms.

*Lifters.*—Wooden beams to which the stamp-heads are fastened.

*Lode.*—Regular vein producing ore.

*Loupe.*—(F.)—Bloom, from the puddling furnace.

*Malle.*—(F.)—Regulus, melted sulphuret.

*Mock lead.*—Blende, sulphuret of zinc.

*Moor-stone.*—(C.)—Granite.

*Mundic.*—(C.)—Iron pyrites.

*Needle.*—A long, tapering piece of copper used in tamping the hole for blasting, in order to leave a cavity for inserting the safety-fuse.

*Pack.*—Gang, or party of men.

*Parcel.*—A heap of ore ready for sale.

*Pass.*—An opening left for letting down stuff to the level.

*Peach.*—(C.)—Chlorite.

*Pick.*—A common instrument for mining and agricultural purposes.

*Pillar.*—A piece of ground left to support the hanging wall.

*Pitman.*—One employed to look after the lifts of pumps and the drainage.

*Pit-work.*—The pumps and other apparatus of the engine-shaft.

*Point of the horse.*—The point where the lode splits or divides into two parts.

*Pot-grown.*—(C.)—Soft decomposed granite.

*Prion.*—(C.)—Soft, white clay, esteemed in Cornwall a favorable sign, when found near a lode.

*Rack.*—An inclined frame on which ores are washed.

*Riddle.*—A sieve for washing the ores.

*Rosette.*—(F.)—Dish of refined copper taken off from the surface by throwing on cold water.

*Run of a lode.*—Its direction.

*Saalband.*—(G.)—Plural *saalbander*, selvages, or thin bands of earthy matter, generally argillaceous, on each side of the vein next the wall-rock.

*Sett.*—The portion of ground taken on lease for mining purposes.

*Schlich.*—(G.)—Finely pulverized ore mud.

*Slag.*—Silicious substances formed in the various processes of smelting and refining, principally silicates of the protoxide of iron, alumina, lime, and magnesia, generally containing a small portion of various metallic substances.

*Shaft.*—A vertical or inclined excavation in the lode or through the country.

*Spleissofen.*—(G.)—Copper refining furnace with two receivers for the fused metal.

*Shears.*—Apparatus for raising or lowering heavy articles in the shaft.

*Shelf.*—The solid rock.

*Shoddy.*—Tracing the situation of a lode by means of the loose masses of ore and veinestone which have been separated from it and scattered in its neighborhood.

*Shooting.*—Blasting with gunpowder.

*Sinking.*—Excavating downwards in the shaft.

*Slide.*—A vertical dislocation of the lode.

*Stickensides.*—Polished, argillaceous surfaces of the rock, caused by the rubbing and grinding of large masses against each other.

*Stockwerk.*—(G.)—An assemblage of small irregular strings of ore, which has no regular form like a true vein, but in which the ore seems to have been disseminated through the fissures in the rocks.

*Stimes.*—Metallic ores mixed with finely-communited particles of the rock.

*Smelt.*—The reduction of metals from their ores by the aid of heat, in the usual metallurgic treatment in the large way, is called smelting.

*Sollar.*—The small platform at the end of a certain number of ladders.

*Spilling.*—Breaking up the rock into small pieces for the purpose of separating the ore.

*Stamp.*—To break up the ore and gangue by machinery, with the aid of water, for the purpose of washing out the heavier metallic particles.

*Stamp-head.*—The iron end of the beam which by its weight breaks the fragments of ore in the process of stamping.

*Slope.*—To excavate the space between two levels by a succession of step-like workings.

*String.*—A small vein.

*Stuff.*—Attle, or rubbish.

*Sump.*—The bottom of the engine-shaft, into which the water is allowed to run, and from which it is pumped or removed by some other means.

*Tackle.*—The windlass, rope, and kibble.

*Tamping.*—The substance with which the hole in blasting is filled after the charge of powder has been introduced; also, the process of filling the hole is called tamping.

*Thrown.*—A lode is said to be thrown up or down when it is intersected by a slide by which a portion of the lode has been removed from its original position to one side or the other.

*Ticketings.*—(C.)—The weekly public sales of ore.

*Tribute.*—The system of working by tribute is that under which the workman receives a certain proportion of the ore which he raises as a return for his labor.

*Trunk.*—A long narrow inclined box, in which the separation of the finely-washed ore from the earthy impurities is effected.

*Tunnel-head.*—The top of a furnace, where the materials are put in.

*Tut-work.*—Work in which the laborer is paid in proportion to the amount done—generally at so much per fathom in driving or sinking.

*Tuyere.*—Pipe through which the blast is introduced into the furnace.

*Underlie.*—The dip or deviation of a vein or bed from the perpendicular.

*Van.*—To cleanse a small portion of ore by washing away the earthy matter, by the aid of a shovel or some similar implement.

*Vein.*—The contents of a fissure in the rocks, of indefinite length and depth.

*Vug.*—(C.)—A cavity in the vein, generally lined with crystals.

*Wall.*—The side of the rocks adjacent to the vein.

*Washing.*—The process of separating the ore from the earthy impurities by the aid of water, the particles of ore and earthy matter arranging themselves in different positions according to their different specific gravities.

*Whim.*—A machine consisting of a drum revolving vertically by horse, steam, or water power, by which, with the aid of a rope and pulley, the ores are raised from the bottom of the mine.

*Whim-shaft.*—The shaft through which the ore is raised by means of a whim.

*Whip and derry.*—The simplest method of raising the kibble by means of a single pulley; the kibble is attached to a rope, which is drawn by a horse.

*Winze.*—A shaft sunk from one level to another, for ventilation, or for proving the vein. A winze differs from a shaft in not being open to the surface, like the latter.

*A VALUABLE REMEDY.*—The Boston *Cultivator* says: "Every family should keep a small quantity of chlorate of potash, (but with great care, as it is one of the most explosive salts known, burning with great heat. Especial care should be had not to allow it to become mixed with dust or charcoal or sulphur, and it should not be exposed to friction.) We have never found anything equal to it for an ulcerated sore throat. Dissolve a small teaspoonful of it in a tumbler of water; and then occasionally take a teaspoonful of the solution, so as to gargle the throat. It is nearly tasteless and not at all offensive to take; hence it is well adapted to children.

Nothing is better than this for chapped or cracked hands. Wash them in a weak solution, and they will soon be well. It is also good for a rough, pimply, or chapped face. It may be had at any druggist's.

## A SCHOOL OF MINES.

Some months since we prepared several articles for the Press upon the necessity of the establishment of a "School of Mines" at some point on the Pacific Coast. The only paper that seconded our efforts in that direction, so far as to even allude to such a project, was the *Washoe Times*, edited by GEN. ALLEN, a gentleman of an enlarged and comprehensive mind, who seems fully to understand our necessities in this particular. Some recent editorial remarks in the *Times* have brought out a communication to that paper upon the subject from which we extract as follows:—

"I would respectfully suggest that such an institution as a 'school of mines,' should be conducted upon the most liberal and extensive scale practicable, in order to make its utility appreciable to the community at large. The vast utility of such an institution as this, if properly conducted, must be of equal benefit to the mill owner and the miner; as the miner, for instance, often finds rock, of the quality of which he is in entire ignorance; this he would bring to the 'school of mines,' where he could learn whether it were worth his time and labor to prospect it. The mill owner receives rock to reduce, with the quality of which he is not familiar; he would accordingly go to the 'school of mines,' where he could not only be informed of the character of the material, but also the best way of treating the same to the most profitable results. Such an institution should most certainly commend itself to all classes of society, both in this Territory, California, and all those interested in the development of the mineral resources of this western world, at least. It would be idle to expatiate upon the details of so important a step as the one you have proposed, until it is seen how the public will appreciate your most valuable suggestion. It is strange that this mineral portion of the continent should have blundered on so long without an institution of this kind, which must at once suggest its importance to even the least reflective mind.

We have a vast country around us, and travel on which ever point of the compass you may, you find a country charged to repletion with mineral wealth, which only requires talent and industry to develop. It is a subject of the most vital importance that labor should not be uselessly applied, and that there should be some guiding power that the miner could have immediate access to, which would direct his course, and from which he could ascertain the probability of the results of his hard work. There is no institution, in a society constituted as this might be, that could have so large a field of usefulness, and one whose influences would be more generally beneficial to all portions of society as the one you have suggested. The capitalist would receive as much benefit as the poorest member of society; he would be able to inform himself as to the nature and value of the mineral for the development of which he was called upon to advance his money, and thereby lessen his risk. The miner would know what he was likely to expect from the labor he was bestowing upon his discoveries. The mill owner would be in no doubt as to the treatment of the various ores that might be brought to him for reduction. We should cease to hear of any one saving their tailings for the purpose of reworking them, and subjects that appear now blindly speculative would, by the aid of such an institution, be made profitable to the whole community.

Wishing your efforts in this direction every success that this vastly important subject demands and deserves, and at the same time not wishing to be placed prominently forward, but willing to afford all the aid my poor ability can in its promotion, and anxious to co-operate with any other gentlemen who may be of the same way of thinking as myself, I remain

Yours, respectfully,

JACKSON BARWIRE.

## CAVITIES IN PRECIOUS STONES.

The Philosophical Magazine furnishes an exceedingly interesting paper by Sir D. Brewster, on cavities observable, by microscopic power, in diamonds, topaz and beryl. Several years ago the learned author discovered in these cavities two new fluids of different density. One of these, named cryptoline, is fixed and oily; the other Brewstoline, is volatile.

From the several curious observations and facts recorded in that paper we extract the following:

"In the Koh-i-noor diamond, which the Prince Consort kindly permitted me to examine in 1852, I found three black specks, scarcely visible to the eye, but which the microscope showed to be irregular cavities, surrounded with sectors of polarized light. In the two smaller diamonds, which accompanied the Koh-i-noor, there were also several cavities surrounded with luminous sectors, and the same polarizing structure which indicated the operation of compressing and dilating forces. In order to obtain more information on this subject, I examined nearly 50 diamonds lent me by Messrs. Hunt & Roskell, and in almost all of them I found numbers of cavities of the most singular forms, round which the sub-

stance of the stone had been compressed and altered in a remarkable manner. The shape of the cavities sometimes resembled those of insects and lobsters, and the streaks and patches of color in polarized light were of the most variegated kind. In examining a large number of diamonds, which adorn some of the oriental objects in the East India Co's Museum, I found that all these stones contained large cavities, and were coarse or flawed diamonds, which could not be cut into brilliants, or used in rings, or other ornaments. It seems, indeed, to be a general truth, that there are comparatively few diamonds without cavities and flaws, and that this mineral is a fouler stone than any other used in jewellery.

Some diamonds, indeed, derive their black color entirely from the number of cavities which they contain, and which will not permit any light to pass between them." Further on he says: "The discovery of pressure cavities in topaz and diamonds may be considered as completing the evidence for the igneous origin of these minerals, and of the rocks which contain them. We know that gas in a state of compression exists in minerals. \* \* \* The gas in these cavities, being exposed to a change of temperature while the substance is still in a plastic state, compresses it and gives it that variation of density which produces four luminous sectors in polarized light."

#### LAKE SUPERIOR COPPER.

The Copper mines of Lake Superior were first brought into public notice in 1845, when speculation was rife in all that part of the Porcupine mountains on the south shore of Superior, extending far into the lake, having for its base a line drawn across L'Arche Bay to Ontonagon. This was then the Northern Eldorado. In this year operations were commenced at the Minnesota mine which is about fifteen miles back of Ontonagon. The first large mass of native copper weighing about seven tons, was found in a pit dug by the original lords of the soil. It is now only fourteen years since this mine was opened. At that time the rapids in the Sault St. Marie prevented the passage of vessels from the lower lakes and the adventurers that sought out this new Eldorado had many obstacles to overcome. The country was then covered by a vast wilderness, without inhabitants, except a few Indians. All supplies were brought from the lower lakes, then had to be passed over the Portage at St. Mary, and thence carried in frail vessels coasting to the westward hundreds of miles to the copper regions, and then carried on the back of man and beast to the supposed places of the copper deposit. Every stroke of the pick was made at a cost ten fold more than in a populated district, every disaster delayed operations for weeks and even months.

The opening of the St. Mary canal, in 1856, has produced a wondrous change in all of this wilderness region. The only settlements on the south shore of the lake at the present time are Marquette, Portage Lake, Ontonagon, Copper Harbor, Eagle Harbor, Eagle River, and the adjacent mines, —all else is a vast wilderness without sign of human habitation.

The Copper region is divided into the three districts of Ontonagon, Keewenaw Point and Portage Lake. Since 1845, 120 Copper Mining Companies have been organized under the general Law of Michigan, more than six millions of dollars have been expended in explorations and mining improvements. The Minnesota Cliff mines have declared and paid over two millions of dollars in dividends since the organization and working of these companies.

Until 1860 all the Copper of Lake Superior mines was smelted at Detroit, Cleveland and Boston. Since which time a Boston company have erected smelting works at Portage Lake Superior, while some Copper ore has been shipped to Liverpool and smelted there.

#### TO MINERS AND PROSPECTORS.

In view of the frequent accidental discoveries of valuable mineral deposits, other than gold, in almost every section of the State, which have of late been made, it is but reasonable to suppose that prospecting even in California, has but just commenced. The simplest and most universal of all metalliferous deposits is gold. It rarely occurs in any other form than that of "free gold" which is readily discernable to the naked eye. An examination of any rock or earth for gold is an extremely simple process. If its presence is suspected in alluvium, the simple washing of that alluvium in a

pan is an invariable test. If in rock of any description; that rock pounded fine in a mortar and washed, in the same manner as alluvium, will usually expose its gold to the naked eye, if there is any there in paying quantity. The only exceptions, are where the gold is contained in iron pyrites, or copper pyrites containing also iron. In either of the two latter cases the presence of gold may be readily ascertained by placing the pyrites in any suitable vessel and keeping the contents at a moderate heat for from four to six hours, with frequent stirrings, by which means the sulphur will be evaporated, and the copper, if any is present, changed to a dull red color, and the gold retaining its natural appearance, on subjecting the whole to the usual panning process, may be readily seen by the naked eye.

Not so with other metals. Silver, copper, zinc, nickel and many others appear in such a great variety of metalliferous forms as generally to defy all but the most practical and scientific eye. No description of these ores can be written which will afford any very important aid to the inexperienced in making explorations. After reading descriptions, however, and carefully examining the specimens described, the explorer may go out and search with some degree of confidence and intelligence. A study of the characteristics of the sulphuret ores alone, would lead an explorer to pass over, entirely unnoticed, the richest varieties of the ores known as Chlorides or Horn Silver, which, from the facility with which they may be worked, and their usual richness, are generally considered the most valuable of silver ores. There is much reason to believe that this variety of silver ore will be extensively found in all the volcanic regions of this State. So with many other ores.

Considering the great difficulty, in the present lack of cabinet collections, and other means of instruction, to acquire a practical mineralogical and geological education in this State, and desirous to aid, to our fullest capacity, the development of our mineral resources, we hereby make the offer to miners, prospectors and all others, who in their travels or explorations may come across specimens having the appearance of rarity or value, to carefully examine and pronounce upon the same, free of charge, as to their characteristics, value, etc., whenever any such specimens are brought or sent to this office free of cost to us. We have already been called upon in many such cases, and we shall at all times be willing to give our attention to any such requests which may be presented to us.

In carrying out the plan we propose, every miner and prospector should be at all times on the lookout for any new mineral. The ordinary rocks with which the miner meets in his travels and labor, and which possess no mineral value are usually well known. Whenever a rock presents any unusual appearance in conformation, color or other characteristic, attention should at once be given to it. There is scarcely a piece of quartz or rock of a quartzose nature, which presents any uncommon appearance in texture or color that has not been thus modified by the deposit or intrusion of some mineral substance. If such rock is found upon or near a vein of quartz it should be carefully examined "in place," and if the cause of its peculiarity is not evident and readily seen, it should not be passed carelessly by. There may be value in it, although the gold may not shine there. We shall commence in our next issue a series of articles describing as accurately and as intelligibly as possible all the ordinary mineral substances which may be likely to come under the notice of the California prospector. These articles will be published under the head of "THE MINER'S LABORATORY," and will be found of great value to the mining public. [*Mining and Scientific Press, April 20.*]

SUBSCRIBE.—Are you a miner and not a subscriber to the MINING AND SCIENTIFIC PRESS? If so, you are an annual loser of many times the price of a year's subscription, particularly if you are engaged in quartz mining. The same amount of practical information, important to miners and mechanics, which is contained in a volume of the PRESS, cannot be bought from the shelves of any bookstore in the country for the price of several year's subscription. Do you ever send a paper to the "Old Folks at Home?" If so, and you desire to send important information and valuable reading matter, you can find no paper that will be read with so much eagerness by them, or one that will convey to them so full an account of the real industry of the country as the MIN-

ING AND SCIENTIFIC PRESS. We invite all to send us their names and four dollars, or two dollars for six months, and become patrons of the only mining paper printed on the Pacific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examination, and with the hope that it may so far meet with their approval as to warrant their subscribing for it at once. It is not our usual custom to receive a subscriber for less than six months; but inasmuch as we are anxious to introduce the paper where it is not now known, we will, for the present, send the Press for three months even, on the receipt of one dollar, in coin or stamps. It is our belief that no one will wish to discontinue the paper after being a constant reader of it for even that short period.

#### MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

THIRD YEAR! VOLUME VI.—NEW SERIES!

A new volume of this extensively circulated paper commenced Sept. 11, 1862. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

#### The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

#### The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

#### The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

#### To Chemists, Architects, Millwrights and Farmers!

This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

#### Terms.

To mail subscribers:—Four Dollars per annum

#### Club Rates.

Five Copies for Six Months, \$8.  
Ten Copies for Six Months, \$16.  
Ten Copies for Twelve Months, \$30.  
Fifteen Copies for Twelve Months, \$44.  
Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 80. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

EWER & SMITH, Publishers,

Room 27, (formerly) U. S. Court Building, Corner of Washington and Battery streets, San Francisco.

#### To Printers.

AN INTEREST in one of the most flourishing and best paying Newspaper Offices in the mountains is offered for sale on easy terms. A rare opportunity is hereby presented to any printer desirous of establishing himself in a good business in one of the healthiest, most thriving and delightful mountain towns in the state. For further information enquire at this office.

#### Our Mint, its Rules, Charges and Operations.

#### For parting silver from gold when gold

is below 300-1000ths. fine ..... 3cts per oz.  
" from 30-100ths. to 750-1000ths fine. 7 cts " " oz.  
" " 750-1000ths to 950-1000ths " 14 cts " "

#### DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce ½ per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300 3cts. per oz. gross weight  
301 " 500, 7cts, " " "

#### DEPOSITS FOR FINE BARS

\$1 16-4-11ths cents per standard ounce, ½ per ct. gross value of silver for making bars; also when gold is contained ½ per ct. on gross value of gold for coining. Refining charges as in purchases.

#### BARs SOLD FROM REFINERY.

\$1 21cts. per standard oz. ½ per ct. gross value to be added for making bars.

#### DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz. ½ per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

#### DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz. ½ per ct. gross value of deposit for making bars.

## GIFFARD'S INJECTOR.

No modern improvement has excited more general attention among engineers than Giffard's Injector, for supplying boilers with feed water, without using a force pump. Although simple in construction, it is apparently inexplicable in its operation, leading the observer to infer that its discovery must have been accidental. It was however the result of scientific investigation by M. Henry Giffard of Paris, who enunciated its theory in 1850, eight years before its introduction into practical use, and again, in a recent work in the French language, has fully illustrated the principles of its manufacture and application. Various explanations of the Injector have been published, but usually with an array of mathematical formulæ, which, to many practical engineers, are more mysterious than the instrument itself. Those who desire an algebraic analysis will find the same in the Journal of the Franklin Institute for May, 1860; but inasmuch as the principle is simple, we present an explanation without mathematical formulæ, by aid of an illustration.

Take a boiler under pressure of steam of 100 lbs. per square inch, with an orifice one inch in diameter, opening from the steam space. The steam would rush out of that opening at a very high velocity, sixteen times faster than water would issue from an opening lower down in the boiler. This we know from established rules. If the issuing steam, at the moment of its exit, could by some means be instantly condensed, it would become a jet of water of one fourth of an inch in diameter; but still possessing the same high velocity. Now suppose that below the water line we make an opening, one-fourth of an inch in diameter, from which there will issue a jet of water; and further let us conduct the former condensed jet by a pipe so that the two jets will play against each other; it is plain that the condensed jet will stop the other and penetrate into the boiler; because it moves sixteen times faster than its opponent.

This is analogous to what occurs in the operation of the Injector: the steam issuing from the muzzle of the perforated tube, being condensed by contact with the cold water, becomes a jet of water of high velocity, which would penetrate into the boiler as above illustrated, with this difference only—that, in the act of condensation, the condensed jet combines with the water that surrounds it, and carries it along the feed pipe into the boiler. The velocity of the compound jet is of course much less than that of the simple condensed jet, but there is still a large margin of force in favor of its entrance in the boiler.

We are not aware of the exact utmost excess of force in the Injector jet, but we know by experiment that an Injector, taking steam from a boiler at 60 lbs., will force water into another boiler at 98 lbs. pressure.

This valuable invention is in extensive use in Europe and the Atlantic States, and during the past two years, in its introduction on the Pacific Coast, has met with the approbation of our engineers, in all cases.

## THE NORTHERN MINES.

The Dalles Mountaineer of late date says that the reports from all parts of the mines of that section, are most cheering. The resident population has been pretty thoroughly sifted of its chaff and those who remain are workers. The adventurers who never rest easy, and who always expect to make a "pile," but never do, have left. The mining season has fairly opened in all parts of the country. In some districts the snow has not entirely disappeared, but operations are going on in spite of obstructions. The gold crop will be much larger than that of any previous season; and promises to rival California in her primeval days. Ditches have been dug and water has been brought to localities that heretofore have been destitute of that necessary article. This has been particularly the case at Auburn, Oro Fino, Elk City, and Florence, from each of which places it is confidently believed there will be a steady stream of gold. At Auburn, the supply of water, as has been stated by a correspondent, is still limited, and by no means adequate to the wants of the miners, but despite this obstacle, Powder River will show a large gold yield the present season. At Elk City and Oro Fino, they will have water for ground sluicing or hydraulic operations, and in that way claims that have hitherto been unproductive, will be

made to yield largely. At Canyon City, one of the richest mining districts in the whole Northern country, the facilities for procuring water have been greatly improved, and it is estimated that the yield from that locality alone will be many thousand dollars. These mines paid well the short time they were worked last season, and with improved facilities there is every reason to believe that they will more than realize the expectations of those who have been most sanguine as to their richness. The great drawback to the prosperity of the mining districts has been the restless character of the population. Too much time has been spent in prospecting, and too little industry applied to the working of the claims.

## GOLDBEARING SULPHURETS, AGAIN.

MR. EDITOR:—The correspondent of the Washoe Times, whom you quote in your paper of the 15th instant, pretty freely condemns certain processes for treating sulphurets. They do not come up to his "ideas." These, he says, he merely introduced in a series of papers; but his description of his own plan leads some to ask, "Can it be anything more than an idea?"

He separates iron from sulphur and fixes oxygen on the iron in the presence of sulphur and of arsenic, which remains unaltered. At what temperature is this possible? Perhaps he never thought of this; for heat seems to be a stumblingblock throughout his calculations. To prove the loss of silver volatilized in roasting sulphurets, he experiments at a white heat!

I this writer ever roasted at a white heat, his ideas of the loss he incurred are doubtless of weight.

Again, according to his "ideas" "sulphurated, arsenicated hydrogen" passes to "flour of arsenic" on reaching air.

Is this effected at a low temperature? if so, what is "sulphurated, arsenicated hydrogen"? Is it like "sulphurous acid contained in the ore"—ready made?

As a writer, this correspondent can make much of little; as a roaster he might neglect the silver and avoid the arsenic. Where is the gold? Is there little, where there where there should be much?

Yours, &c., A POOR CHEMIST.

ERRATA.—In an article headed "THEATRICAL", on the 5th page of our last issue, "The singing is of the first-class character, with the solitary exception, perhaps, of a little too much instrumental accompaniment," should have read, "The singing is of first-class character, with the solitary exception, perhaps, of a little too much instrumental accompaniment."

MINING GLOSSARY.—We devote a large space, in our columns to-day, to a very carefully prepared, and very full mining glossary. We extract it from Foster and Whitney's Report upon the Lake Superior Copper Mines. It will be found very valuable, to all miners, for occasional reference, and occupies a legitimate position in our "Miner's Laboratory."

CORRECTION.—In our issue of last week we alluded to the Stone Breaking Machine, at the foot of Market Street, in this city, as the one known as "Blake's Stone Breaker." We wrote from hearsay, but have since examined the same, and find it is something of very different construction, but an excellent machine for the purpose to which it is applied. The machine is manufactured in this city at the Pacific Foundry, by Goddard & Co. We shall notice it more fully, at some future time.

We were also in error with regard to the Foundry where the "Young America Quartz Crusher" can be obtained. That machine is also made at the Pacific Foundry, where several may now be seen, which have been constructed for a Mine in Mexico.

REMOVAL.—J. C. E. Kleyzig, & Co., have removed from their old stand on Battery street, to 733 Washington street, near Kearny. Sportsmen and others requiring anything in their line will do well to give them a call. See advertisement.

## THE MINING SHARE MARKET.

There has been some improvement in the Mining Share Market during the past week, produced by favorable reports from several leading mines. A fair amount of business has been transacted and some little excitement experienced. The disposition to sell on the part of those who hold stock of intrinsic value, is constantly diminishing, and so far as they are able, all such are regularly paying up their assessments, and closely watching the development of their mines. Mining operations, on Montgomery Street, are fast becoming a legitimate business.

Gould & Curry, which opened the week at \$5500, has gradually advanced to \$6100. Twelve shares have been sold at the latter figure. This important advance has been produced by information from the mine, that in a tunnel 200 feet lower than the mine has hitherto been worked, a fifteen foot ledge has been struck, averaging \$500 to the ton.

Ophir shares have also materially improved during the week, and are now quoted at \$2400, with considerable sales and more enquiry.

Savage was quoted on Saturday at \$4000, an advance of \$1200 during the week. A large number of transactions in these shares were reported during the week, at gradually advancing rates.

Chollar, has had an even Market, with small transactions. Potosi, sold at \$460; no new features.

Wide West has attracted some attention, during the week, 251 shares having changed hands at \$175 @ \$216.

## THE COPPER INTEREST.

We have nothing new, of special interest, from Copperopolis during the last six days. The Union claim has three shafts sunk to a considerable depth, from each of which they are taking large quantities of rich paying ore. At each of these shafts is a steam engine for hoisting the rock. Immense piles of what is called number three are lying at each of the shafts—too poor for transportation until it is reduced. It is estimated that there is more than \$100,000 worth of this number three rock now on the surface of the Union claim.

The Keystone is now under the working direction of some skillful and energetic copper miners, who intend to prosecute operations with energy. We learn that 1,000 workmen will probably soon be employed at this mine.

The Oriental, in Amador County, have thus far expended only about \$1200 upon their lead, and yet they have about \$5000 worth of ore upon the ground, and are seventy feet deep upon their mine. The Company is out of debt, small, and there is none of its stock in the market.

The mines of El Dorado, Placer, and Nevada, are still progressing, although we have not yet heard of any shipments of ore from that direction.

The Humboldt Register says: "The Sheba mill continues concentrating rock for shipment. Thursday, three six-mule teams started with concentrated rock to be shipped from San Francisco to England."

INDURATED PLASTER.—Objects in plaster of Paris may be rendered like marble by coating them one or more times as may be necessary, with a liquid prepared as follows:—2 pts. of stearine and 2 pts. of Venetian soap, are mixed with 20 or 30 pts. of cold solution of caustic potassa; and after a half-hour's ebullition, 1 pt. of pearl ash is added and the heat

MORE MINES.—New and rich gold and silver mines have been recently discovered in the vicinity of Carson City—a region where the precious metal has not been found hitherto, continued for a few minutes. Cold ley in sufficient quantity to produce perfect fluidity is then stirred in, and the liquid set aside for several days under cover.

Lost!—A Silver, Lever Watch, hunting case, supposed to have been lost on Bush Street; the finder will be suitably rewarded by leaving it at this office.

WANTED.—A full set of Patent Office Reports (Mechanical) Inquire at this Office.

FIRST FROM REESE RIVER.—Wells, Fargo & Co. made their first shipment of bullion from Austin, Reese River, on June 11th. It was twenty pounds, the result of one week's work in a small arrastra.

## GENERAL MINING STOCK REPORT.

## REPORT OF BIDS

At the San Francisco Mining Stock Board,

For the week ending June 20, 1863.

Names of Companies.	Total No. Shares.	Shares per ft.	Par Value.	Monday.	Tuesday.	Wednesday.	Thursday.	Friday.	Saturday.

## REMARKS.

The Virginia Market has been exceedingly dull since the date of our last reference, and except upon the Main, or Comstock range, there has been something of a decline, as will be observed by our quotations. Prospecting, however, is progressing energetically, and very encouraging developments are being made on what may be denominated outside ledges.

In Gold Hill stocks, much more feeling is manifested, and a very general advance is occurring. During the past two months, developments of a very satisfactory character have been made in this district; nor are they confined to the "main range." The back ledges are beginning to yield with fair promise. But along the "main range," and the three ledges constituting it, discoveries are daily being made giving rise to the wildest predictions. The ledge upon which the Belcher is located, is indisputably one of the very richest in the Territory. It is the ledge lying east of the Crown Point vein. Notwithstanding the occupancy of the same ground by the Koh-i-noor, the Belcher is held firmly at the advanced quotations given. This same rich vein runs, it is presumed, through the Leon, and has been struck in the claims of Gold Hill proper, the Princess and the Bullion. This ledge is, without the shadow of a reasonable doubt, entirely distinct from the back ledge. That they are one, is the theory upon which are based the suits between the Yellow Jacket and Princess and Union, and the Belcher and Koh-i-noor. We refer the reader to our figures for further information.

## REMARKS

The "Crockett" Ledge on Last Chance Hill is still increasing in richness.

The last crushing of 22 tons paid \$3,189, averaging \$145 per ton; the shaft is now down to a depth of 50 feet, and

the ledge over five feet wide. The company have a large amount of very rich rock at the shaft, which is being hauled at Stark & Tucker's Mill. The owners in the claim are not disposed to offer any of the stock for sale; 15 shares were sold on the 9th at \$85 per share.

The "Clan Alpine" ledge on Last Chance Hill, a recent discovery, is proving very rich. The rock assays \$1700 per ton. The company have taken out about thirty tons of rock, which will be crushed immediately. The owners in the ledge are sanguine that the rock, without assorting, will pay over \$200 per ton; \$12 per foot was offered yesterday and refused. The ledge is about two feet wide and increasing in thickness as they go down.

The "Mary L. Gardiner," on Silver Hill, contiguous to the Young Winnemucca, is proving to be a very rich ledge; the shaft is down about thirty feet, and the ledge over four feet wide. The company have taken out about forty tons of rock, which will be crushed at Stark & Tucker's Mill. The last assay went over \$7,000 per ton; \$100 per share has been offered and refused for the stock.

The "Princess Royal" and "Geraldine" claims on Silver Hill, are also turning out rich rock. The work on both claims is being vigorously prosecuted, and from every indication from the rock now being taken out, the owners will be richly rewarded for the money and labor expended on the claims.

THE METROPOLITAN.—On Friday night, by the remembrance of our friend Warren, we enjoyed the pleasure of being present at the Hook and Ladder benefit. The house was not so full as we had hoped to see, or as the performances deserved. The Bianchis, and Grossi were in splendid voice. Amidst much good singing we thought Mme. D'Ormy's, taken altogether, was unquestionably the most finished we have heard in this city. She is not yet appreciated. We have been too long accustomed to screaming and bawling, to realize at first, the beauty of D'Ormy's voice, the assured ease, and perfect grace of her execution. Her time, however, will come. Mrs. Edwin and Mrs. Judah were good as usual. We wish the boys success.

MAGUIRE'S OPERA.—The present has been, indeed, a star week at this house, offering a combination of talent seldom brought before the public on this coast. To individualize, where all deserve praise, were invidious; but we cannot refrain speaking of Mrs. Hayne, Mr. Taylor, and the local favorite, Mayo, as they deserve. The Lady of Lyons, Romeo and Juliet, and the School of Scandal, we thought presented some exquisite and finished acting from each member of the combination. In many scenes of these pieces, criticism was disarmed. The educated and intellectual portion of our community, should by no means neglect visiting Maguire's, during this carnival of acting in California, for by doing so, they not only lose a rich feast themselves, but pay a poor compliment, to the energy and liberality of the Management, at present sparing no expense to merit their patronage. The legitimate drama is a great institution.

THEATRICALS.—At the Eureka, this week, the performances and the audiences have both been excellent. In addition to the general attractions of this favorite resort of mirth-loving people, O'Neill presents his "Irish Excentricities." Cotton's old "Uncle Snow," his favorite character, is a splendid piece of acting. Night after night he convulses the house. The other principal good things were "Running the Blockade," and Birch's "Pres-dig-a-ta-ter," both admirable burlesques. By the way, while Gideon's band at the Eureka, ridicule the poor Englishman's "h," we find Mrs. Mowbray at Maguire's continually using "don't never," and other American double negatives. Why not ridicule the more censurable error, or avoid it?

DASHAWAY HISTORIC.—We beg to call attention to the next Dashaway Historic, on this day week. It is enough to say one of the "indefatigable Badgers," takes a leading part. Seriously speaking, this is one of the best amateur clubs in the State, well worthy of patronage. Apart from a strong cast in the beautiful play of Ingomar, the entertainment concludes with a grand dance. The cause also is good, and with such a programme, we wish them a full house.

A PIRATE'S SALARY.—The head gunner on the pirate Alabama, is one of the most accomplished artillerists that was ever in the British navy. He was paid off and got his discharge a few weeks before the Alabama sailed, and instead of enlisting in her Majesty's navy, took a commission on the pirate at the very round sum of two hundred pounds sterling a month, in gold, which, at the present price of rebel paper, is the moderate salary of forty two thousand dollars a year.

**A New Work—Important to all Mining Companies.**

Win. A. Andrews & Co., a new firm in New York, who propose to open a Pacific Mining Agency in that city, are preparing a work to be issued about the last of July, embracing a synoptical statement of all Mining Co's in this State and the adjoining Territories. It will be published in pamphlet form, and 50,000 copies distributed, *gratis*, in the Eastern States, with the intention of bringing Pacific Mining Stocks more particularly to notice in the East, for investment and information of the mass of the people, outside of the leading capitalists of New York and Eastern cities. Such companies as are prominent before the public, and those whose prospects are deemed worthy, will be embraced in the 1st Volume. A 2nd Volume will be issued to include all new companies formed subsequent to the compilation of the 1st. An opportunity will be offered to advertisers, for a few outside pages in the work. MR. LEIGH HARNETT is Advertising Agent, and MR. J. A. WOODSON, San Francisco Corresponding Agent, of whom further information can be had.

All Companies upon whom the Agents have not called, will please address us as above, and answer, as full as may be, the following questions :—

1. Name of Company.
2. When discovered.
3. Where located.
4. When incorporated, and where.
5. Extent of Claim.
6. Capital Stock.
7. No. of Shares.
8. Assay per ton : Gold, Silver, and Copper.
9. President and Secretary, Board of Trust's.
10. Location of Office.
11. Such additional information as may not be answers to the foregoing interrogatories.

Note.—Specimens of Ore requested, labeled, for reference in Cabinet of New York Office.

W. A. ANDREWS & Co.,  
Pacific Mining Stock Agents, New York.

SPECIAL NOTICE.

We wish it distinctly understood that all the interest which Julius Silversmith ever had in the MINING AND SCIENTIFIC PRESS, ceased in November of 1862. EWER & SMITH are now the publishers and proprietors.

**F. E. WEYGANT.****Volcanic Smelting Furnace.**

PERSONS DESIRING INFORMATION AS TO THE USE and economical properties of this Furnace, and intending to make use of the same, when satisfied of its superiority over all other means of reducing ores and separating metals from the sulphurets, can obtain all needed explanation and advice in regard to the same, and the terms of sale of rights to use the same, on application Col J. D. Stevenson or T. Ogg Shaw, or by letter to the proprietress through the Post Office of San Francisco. Drawings may be seen at the office of Col. J. D. Stevenson, No. 614 Merchant street, or at the office of T. Ogg Shaw, in Brannan's Building, Montgomery street.

The time required for reducing ores by this Furnace is from three to eight hours, and the amount of fuel only one-tenth as much as is consumed by other processes.

The process of condensation is applied to this Furnace which will save all these portions of precious metals which usually escape in a volatile form. The attention of all interested in the subject is requested to examine the important results obtained by this process.

Parties wishing will be allowed to erect a trial Furnace of a capacity for smelting one ton of ore or more, on signing an obligation to pay the usual fee for the right to use it, should they continue to make use of the invention or a longer period than two months.

**BAUNCHEIDTISM,**

THE PRESERVER AND PRODUCER OF LIFE.

**THE EFFECT OF BAUNCHEIDTISM AS A METHOD OF** curing disease, is a "fait accompli" in medicine, and needs no more proof. The public has crowned Bauncheidism already with an extraordinary patronage, and it is acknowledged by all men of science that BAUNCHEIDTISM is founded on a rational, scientific basis.

It can safely, and with sure success be applied to paralysis in consequence of Apoplexy, Podagra and Rheumatism of every description, which kind of complaints can find their only relief by the above method.

Especially can it be applied successfully, in the spring of the year to diseases of the eye.

Dr. Borchers in San Francisco, and Dr. C. J. Marx in Sacramento, are the only doctors in California who have the original series of Dr. BAUNCHEIDT and his original oil. Dr. Borchers is also in possession of original letters of the inventor of the method by which he can prove that he is the best master of the latter.

Dr. J. C. BORCHERS,  
No. 19 Kearney street, and No. 4, Mark's Place, First story, No. 5. Office hours from 9 to 11 A. M., and 1 to 4, and 7 to 9 T. M. je21

**The Pacific Mineral Company**

**MAKE LIBERAL ADVANCES UPON THE ORES OF**  
COPPER, SILVER, TIN, NICKEL, COBALT, ZINC,  
LEAD, AND SULPHURETS CONTAINING GOLD.

Due account taken of all valuable metals combined with Silver and Copper Ores, and advances made therefor.

Parties owning undeveloped mines and desiring capital to prospect the same will receive assistance, if, upon examination, such leads are deemed sufficiently valuable to justify such expenditure.

OFFICE, No. 1, ODD FELLOWS' HALL,  
je1-tf Montgomery Street, San Francisco.

**MARTIN & Co.,**

OFFICE--224 Montgomery Street, Up Stairs,

WILL CONTRACT FOR THE

**Purchase of Copper Ores,**

Assaying 8 per cent and upwards of Copper to the Ton.

We will make ADVANCES upon Ores of COPPER, TIN and NICKEL.

Sacks will be furnished and Freight Paid on all consignments if desired by the consignors.

**WHEELER'S**

Amalgamating and Separating Pans.

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of triturating, and in cleaning up. By the introduction of the Separating Pan to follow the triturating this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated on the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

\* \* \* These Pans can be seen in daily operation at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves.

PROPRIETORS.

VOL. VI.

SAN FRANCISCO, MONDAY EVENING, JUNE 29, 1863

NO. 35.

## THE PLATTNER PROCESS.

Mr. Editor:—I find there is much misapprehension here as to the "Plattner Process" for extracting gold from sulphurets, and the extent to which it has been used. Mr. Hittell even stated in 1861 that it had not been "used on a large scale." The fact is that it is so valuable that it enabled the Reichenstein mine, in Silesia, which had been closed for centuries to be reopened and worked. In 1851 a Council medal was awarded to Herr Plattner and Gueltnner for its successful application there. The ore is pyrites, containing arsenic and about 200 grains of gold to the ton. It is roasted and the arsenic volatilized and condensed—the burnt pyrites, chiefly oxide of iron, is placed in a vessel, where it is subjected to the action of chlorine. This renders the gold soluble in water, and the gold is afterwards precipitated from the solution, and then reduced to ingots. Professor Muscott very justly observes on this, that it is equally applicable to the vast quantity of refuse accumulated at other old works. Yours, &c.,  
San. Fran., June 27. A POOR CHEMIST.

## CAST CHANGED TO RAR IRON.

Sterling's process for the conversion of cast iron into iron is deserving of consideration:—  
To a given weight of cast iron, about 1-20 to 1-5 much scrap iron is added, most conveniently by putting the scrap-iron into the hollows which it is desired to fill by cast iron run directly from a blast furnace. The pigs are puddled as usual, taking care at the whole be thoroughly melted. The stream of cast iron may also be run upon the hearth of a reverberatory containing scrap iron, heated to a point below welding; the heat is raised until both are incorporated, and the metal is then run into a puddling furnace. With better qualities of cast iron, from 1-10 to 1-3 of scrap iron may be used. In order to obtain malleable iron, harder, less fibrous, and more granular than usual,  $\frac{1}{2}$  or 1 per cent. of tin is added to the malleable iron mixtures above described. Bismuth,imony and arsenic will produce a similar effect. Each hard iron is said to work well while hot, under a hammer, in the squeezer, between the rolls, and in smithy. Zinc may be used in the form of a calamine, about the same quantity of copper also gives additional hardness of iron. Black oxide of manganese in the proportion of  $\frac{1}{2}$  to 1 per cent. of the mixed malleable iron, gives a steely character to it, hardening the iron and facilitating the puddling process.

**ARTIFICIAL GEMS.**—To make gems, Elbemen avails himself of the two properties of boracic acid, of dissolving metallic oxide by fusion, and volatilizing at a higher heat. His process resembles the solution of substances in water and the evaporation of that water to obtain crystals. Having made a mixture of alumina and magnesia, in the proportions as they exist in spinelle, and added 1 per cent. of bichromate of potash, he added two pts. of this mixture to 1 pt. of fused boracic acid and exposed it to platinum resting on porcelain to the heat of the porcelain furnace of Sevres. The product contained cavities lined with minute rose-red, octahedral crystals, harder than quartz and infusible before the blow pipe.—They had all the characters of the ruby. The constituents of emerald, treated in the same way, yielded small hexagonal crystals, harder than quartz, and therefore agreeing with true emerald.

THE BRYAN BATTERY.

The accompanying cut represents the "Bryan Battery," manufactured by Goddard & Co., at the Pacific Foundry in this city. This Battery is now extensively employed in every section of the State, the adjoining Territories and Mexico, and possesses many advantages over most of those in use. One very important advantage attendant upon this Battery is the small expense of its erection and the facility with which it may be moved from place to place when found desirable. Being constructed almost entirely of iron, it is not effected by the alternations of heat and moisture, which produce such a damaging effect upon all structures of wood, in the interior portions of the Western Slope. The mill is also adapted to dry as well as wet crushing. Each Battery is complete in itself and others may be added from time to time, as occasion may require, without making any important changes in the arrangement of the mill, or machinery. The Batteries after being constructed are always put up at the Foundry and perfectly fitted, before being sent off. Perhaps one of the best recommendations, which can be offered

in behalf of this Battery is the fact of its introduction into so large a number of mills as are enumerated in Goddard & Co's Circular. See advertisement of this Mill on our last page.

A BOARD OF BROKERS INCORPORATED.—The San Francisco Board of Brokers on Friday filed its certificate of incorporation. Capital stock \$125,000 in 125 shares of \$1,000 each. Trustees.—Samuel Purdy, G. M. Blake, J. Shaffer, A. J. Tobias and J. D. Stevenson.

A CLOCK FOR THREE PENCE. An ingenious time taker has been invented by a citizen of Manchester. It is a small card, on the face of which hangs a weighted string. The card is so figured, that by holding in the sunshine, a bead on the string will indicate the solar time. By it the hours of sunrise and sunset may be also ascertained. It is, undoubtedly, the cheapest time-piece that ever was devised.

## GREAT BASIN MINING COMPANY.

The above named association is now fully organized and prepared for active operation. The Company holds 55,000 feet, chiefly in Humboldt County, Nevada Territory:—Among others, on the following ledges:—Clyde ledge, Occidental series, Neptune series, Auld Lang Syne ledge and Frost ledge. Besides which the Company owns several town sites, large quantities of wood land, etc., etc.

The Capital Stock is \$5,000,000. The names of the parties interested are as follows:—President—George C. Johnson. Treasurer—George W. Gibbs. Trustees—George C. Johnson, Messrs Billings, Teschemacher, McAllister and Jessup.

Secretary—J. H. Blood. Members—W. J. Tilley, (Sneath & Co.), Thomas Bell, (Barron & Co.), W. C. Little (at Parrott & Co's), A. P. Stanford (Stanford Brothers), R. M. Jessup (C. S. Navigation Co.), John Wedderspoon (Cross & Company), Solomon Hydenfeldt, Robert Turner, (Turner Brothers), Hall McAllister, J. C. Lund (at Cross & Co's), Charles Pace, George C. Johnson, John H. Saunders, Dr. C. C. Knowles, Henry F. Teschemacher, G. W. Gibb, Frederick Billings, Henry M. Hale, James Kellogg, H. M. Whitmore, O. E. Johnson, P. N. McKay, Jonathan Williams and E. R. Highton.

## COPPER UPON THE EASTERN SLOPE.

Mr. Alexander Hertlein, has left with us some fine specimens of copper ore taken from a ledge recently opened in the Sullivan District, East of Carson River, and six miles distant from Winter's Mill. The ore consists mainly of Blue Carbonate and assays for copper alone, 24 per cent. Quite a number of assays have been made from this vein, for gold and silver, the average result of which, in addition to the copper, is about \$20 in gold, and \$18 in silver. The Company consists of three persons, beside Mr. H., and they hold 1200 feet. It is known as the Red Fox Ledge. This, we believe is the farthest point northward at which copper has been discovered on the Eastern Slope. From this region, southward, into Mexico, copper is found at almost all points. Our friends on the Eastern Slope are beginning to turn a large share of their attention to copper, not neglecting, the while, either gold or silver.

NOTES OF A TRIP TO SLATE RANGE *via* LOS ANGELES AND EL PASO.—No. 3.

## EL PASO.

APRIL 22nd. Two of our party having concluded to remain here, we took off our freight and pitched our camp in Mesquit (don't know about the spelling of this word—pronounced Mayskeet) Cañon, where a patch of that beautiful bush grows about 8 feet high, covering a space of about 20 feet square.

This is the only growth of the kind in the neighborhood, and, with the springs near by, will probably form the nucleus of a great city, *poco tempo*. One of our party having contracted at Los Angeles, to drive one team through to Slate Range, passed on with the train, in the afternoon, with instructions to stop there and report, if good, or return.

## IN CAMP.

The first thing to do, after pitching tent, was to get supper. We have to go out on the plain, nearly half a mile, where we find plenty of grease-wood, which grows in bushes twenty to forty feet apart, twenty-five to one hundred stems rising from one root, some as large as the thumb and many as small as pipe stems, and from four to eight feet high branching in every direction, so that one can only with difficulty, approach near enough to cut the stem at the base. This is very laborious, and generally results in bleeding hands and wrists, unless protected by strong gauntlets. With a rope, we tie up as much as we can carry and pack to camp.

## AN UNPLEASANT NEIGHBOR.

While working into my first bush, I found a nice little rattlesnake coiled up within four inches of my bare hand. I soon dispatched him and found he had only a button on his tail, showing that he was not yet eighteen months old. This greasewood makes the hottest fire of any wood I ever burned, for in five minutes after applying the match, I found the heat strong enough to melt away all the soldered parts of a coffee-pot. *Mem.* An iron coffee pot, well riveted, is the only style to be used here.

## AFTER SUPPER.

In twenty minutes supper was disposed of, and it being very dark, we concluded to visit a neighboring tent, fifty feet distant, and the only one up when we were around. There we found the entire population of the District assembled under a canvas about twenty feet square, also the population of our ox-train, with Mr. McCaffey, as chorister, all actively engaged in singing the popular songs of the day, and all determined to have a jolly time so long as Mac could be with them, as he leaves on his horse in the morning, to overtake his train, now on its way to Slate Range.

## TAKING THE CENSUS.

I improved the opportunity here presented to take a census of the District as a reference, hereafter, to know who might be entitled to a diploma as pioneers. I registered the following names:—

Theophilus Cobb, *via* Virginia, Kentucky, Visalia and Slate Range, here.

Griffin H. Williams, New York, Los Angeles, San Bernardino, Slate Range.

David M. Porter, *via* Los Angeles, here.

David Teass, Missouri, Los Angeles, Slate Range.

Peter A. Turner, Virginia, Texas, Visalia, Slate Range.

Albert F. Meyers, Texas, Visalia, Slate Range.

John C. Steger, Missouri, Volcano, Slate Range.

John D. Yarborough, Mississippi, Soledad, Slate Range.

Geo. W. Yarborough, " " " "

A. J. McGaffey, Los Angeles, Forwarder.

Four of the above were absent on a trip to Slate Range, for their tent, tools and grub. But as they came in the next day, and had been here before, they are entitled to be classed among the Pioneers, as well as our own party. These now form the nucleus of the future rich and populous District of El Paso. So we retired, "by the light of the moon," nearly all, to our blankets in the sand.

## A VIEW OF THE COUNTRY.

! APRIL 23d. Up before the sun to look around us to see what kind of a land we are in. From a barren hill of something like ashes, near by, we take an observation. As we look south-west, over the road we came, we notice a great

barren plain, as far as the vision extends, with a chain of mountains bounding it on the right, and another opposite us and about 15 miles distant, running 15 to 20 miles south-westerly, making the plain below us an arm of the Great Desert, about 20 miles long, to the range north-easterly, over which the road leads to Slate Range, through the El Paso.

About three miles back commences a small alkaline lake, some eight miles long by three to five broad, resembling a sheet of ice. Not a bush or tree is in sight larger than the musquit by our camp. All is barren, the mountains generally appearing like cones of ashes, sharp and precipitous. Not a drop of water is any where to be found, except at six points within forty-five miles, viz:—Laurel Hill, Mesquit Springs, Mountain Cañon, Desert Springs, 12 miles, and Sink of the Tehachepe, 40 miles, and Can or Grape Vine Springs, 9 miles south-west.

Nothing can exceed the barren and desolate condition of this country, while the thermometer ranges from 102° in the cooler places, to 122° in our tent, when closed, from 10 o'clock to 3 P. M.

## THE MINES.

We amuse ourselves to-day, in examining specimens in camp from the various leads:—Tucker, Eureka, Comet Mammoth, Boston, Ben Lohmon, Gov. Downey, Laurel Hill Manzanillo and Almadan. All look good—some very rich. We shall visit them.

24th. Put on my wooden soled shoes and started out early to prospect and examine the lodes already taken up. We find that half a dozen men have been very busy here most of the time since last November and have lodes taken up in all directions, particularly in the vicinity of Copper Mountain and Copper Basin. They abound in Lodes in which copper seems to predominate, though the universal opinion prevails that they will run to silver. Perhaps they will, but very little is actually known of the real value of the rock and much labor is to be expended before anything like a certainty can be arrived at. Two or three feet seems to be as low down as any one has yet sunk on their lodes, and none seem to be in haste to work down while there is a good chance to prospect.

## DISTRICT MINING LAWS.

The laws here are very liberal, giving a year to prospectors to do any work, if a record is made within 30 days after location! For the good of the country and new comers, we must try to have this law changed to a shorter time, so as to abridge prospecting and making a show of work done on the ground.

**FIRE CLAY FROM FUSIBLE CLAY.**—A good quality of clay, but not fire clay, is mixed to a paste with muriatic acid, and after some time heated to boiling.—The acid is run off the clay fully washed and dried. Clay thus treated was made into crucibles, in which bar iron was fused, without their becoming softened by heat. The acid simply extracts a large proportion of the bases (lime, iron, &c) which tend to flux the principle part of clay, the silica and alumina; but the question of economy will influence the use of this remedy for the fusibility of clay, and it is doubtful whether the process will be adopted by manufacturers.

**HYDRAULIC CEMENT.**—When finely powdered marble, limestone, or chalk, is mixed to a paste with milk of lime, it hardens rapidly like hydraulic lime, has a feeble alkaline reaction, and resists water tolerably well. The mass is plastic and may be used to take large or small impressions.

The analysis of a genuine Roman mortar from Pompeii, leads to the inference that the Romans prepared their mortar from a mixture of caustic and carbonate of lime, with the addition of pulverized calcareous spar.

**NEW MOTOR.**—M. Boutet, a French engineer, residing in Brussels, has invented a machine which it is said is likely to do away with the employment of steam as a motive power!

The machine is worked by hydraulic pressure, the principle being applicable alike to locomotives and stationary engines. Experiments just made with it at Brussels have been attended with complete success.

**THE AURORA QUARTZ MILL.** on Bodie creek, Aurora, Mono county recently took out from one weeks run, as much amalgam as four men could carry!

## GEOLOGY AND GOLD IN ASIA MINOR.

A distinguished English Civil Engineer, C. E. Browning Esq., recently delivered a very interesting lecture before the Smyrna Literary and Scientific Institution, on the "Geology and Gold in Asia Minor," from which the following extract is taken:

"To the geologist this country offers a field of observation that will well repay the time expended upon it. To account for the gradual rising of the land on a tideless coast, and to speculate on the effect that future elevation will produce on the country, are points full of the greatest interest, not only to the man of science, but it is a most important question to the Govt and the inhabitants of the country. The river beds are rising so rapidly, that if human agency does not counteract the influence of Nature (and it is not probable that the Turks will do anything, as they prefer to let Nature take her course,) the greater part of the plains in the interior will become waste marshes, hot beds of malaria, fevers and plague. For instance, let us turn to the natural drainage of the western part of Asia Minor, or what I will call the Smyrna Watershed, which is at least 10,000 square miles in extent and is drained by only two rivers, the Hermus and the Caister, neither of which is navigable, and both of which have within the historic period become so raised, that the mouth of the former is about 15 miles nearer the sea, leaving a passage now of less than half a mile to the opposite shore; at the Cayster has advanced at least another ten miles. On the southwest coast this encroachment is still more visible."

I leave you, therefore, to imagine what will become of the vast amount of rain that will fall upon these 10,000 square miles in time to come, when the rivers are still more raised and consequently less able to carry off the water. Let us examine the rocks that exist—it is an almost unexplored district. Smyrna has added scarcely a fossil to the cabinet of Europe; and in what museum is its metallic wealth displayed. Here are mines of silver, lead, antimony, copper and iron, almost unrivalled for their richness; and I have ventured an opinion that the day is not far distant when the gold diggings of Asia Minor will attract thousands to Smyrna. Lignite coal exists in incalculable quantity, and though it has been proved unfit for the manufacture of gas, its proximity to a rich iron district will render it a most valuable addition to the resources of the empire. An abundant supply of the finest kaolin provides what is necessary for the manufacture of the costliest pottery; while from the commoner sorts of clay the home requirements of the lower branches of the ceramic art can be supplied. The geological student, in his rambles in this country, meets with rocks of all classes, from the most recent alluvium to the oldest of the primary rocks—from the volcanic cone, forced to the surface by internal fire, to the stalactite deposited by drops of water.

The Calaveras Chronicle says that within five years there will be 10,000 inhabitants in Copperopolis and vicinity.

**WANTED.**—A full set of Patent Office Reports (Mechanical) Inquire at this Office.

A PIRATE'S SALARY.—The head gunner on the pirate Alabama, is one of the most accomplished artillerists that was ever in the British navy. He was paid off and got his discharge a few weeks before the Alabama sailed, and instead of enlisting in her Majesty's navy, took a commission on the pirate at the very round sum of two hundred pounds sterling a month, in gold, which, at the present price of rebel paper, is the moderate salary of forty two thousand dollars a year.

**A New Work—Important to all Mining Companies.**

Wm. A. Andrews & Co., a new firm in New York, who propose to open a Pacific Mining Agency in that city, are preparing a work to be issued about the last of July, embracing a synoptical statement of all Mining Co's in this State and the adjoining Territories. It will be published in pamphlet form, and 50,000 copies distributed, *gratis*, in the Eastern States, with the intention of bringing Pacific Mining Stocks more particularly to notice in the East, for investment and information of the mass of the people, outside of the leading capitalists of New York and Eastern cities. Such companies as are prominent before the public, and those whose prospects are deemed worthy, will be embraced in the 1st Volume. A 2nd Volume will be issued to include all new companies formed subsequent to the compilation of the 1st. An opportunity will be offered to advertisers, for a few outside pages in the work. MR. LEON HARNETT is Advertising Agent, and MR. J. A. WOODSON, San Francisco Corresponding Agent, of whom further information can be had.

All Companies upon whom the Agents have not called, will please address us as above, and answer, as full as may be, the following questions :—

1. Name of Company.
2. When discovered.
3. Where located.
4. When incorporated, and where.
5. Extent of Claim.
6. Capital Stock.
7. No. of Shares.
8. Assay per ton : Gold, Silver, and Copper.
9. President and Secretary, Board of Trust's.
10. Location of Office.
11. Such additional information as may not be answers to the foregoing interrogatories

Note.—Specimens of Ore requested, labeled, for reference in Cabinet of New York Office.

W. A. ANDREWS & Co.,  
Pacific Mining Stock Agents, New York.

## SPECIAL NOTICE

We wish it distinctly understood that all the interest which Julius Silversmith ever had in the MINING AND SCIENTIFIC PRESS, ceased in November of 1862. EWER & SMITH are now the publishers and proprietors.

## THE MINERS' LABORATORY.—NO. IX.

## DESCRIPTION OF THE MODE OF DRESSING COPPER-ORES IN CORNWALL.

The ores consist chiefly of copper-pyrites, intermixed with small quantities of other cupriforous minerals, iron pyrites and the constituents of the vein in which the ore is found.

The ore is drawn from the shaft to about 30 feet above the surface and taken in wagons to an adjoining dressing floor, where it is allowed to fall from this height on two rows of inclined bars, by which means it is separated into three divisions or sizes, called *ricks*, *roughs* and *smalls*, for convenience of dressing. In the first or top row of bars, which separates the rocks, the bars are 4 inches apart, and in the second row, which divides the *roughs* from the *smalls*, they are  $1\frac{1}{2}$  inches apart.

The *rocks* are broken by a process called *spalling*, into pieces of about one pound weight each. A small hammer called a *sledge*, is used in this operation, which is conducted generally by girls, who carefully separate the ore from the refuse. The richest part of the selected ore termed *prills*, is taken without any further preparation, to the crusher which consists of two iron cylinders, or rolls revolving against each other. They are worked by steam or water power, and between them the ore is passed, and reduced to a size small enough to pass through a sieve divided into holes of  $\frac{1}{2}$  inch square. The preparation of the ore is now completed. The poorest part of the ore selected from the *rocks*, called *dredge*, containing from 10 to 20 per cent. in copper, disseminated through a large bulk of matrix, is also crushed and passed through a sieve of holes about  $\frac{1}{4}$  inch square. This prepares it for what is called *jigging*, of which the object is the separation of the ore from its matrix. The ore is put into a sieve of holes one-sixth inch square, suspended in a large cistern of water. An up and down motion is then communicated to it by a break-staff, or lever worked either by girls or by steam or by water power. By this operation the lighter particles or refuse, on account of their lesser specific gravity rise on the top, and are carefully skimmed off with a small wooden scraper. The ore that passes through, together with what stands in the bottom of the sieve, is then ready for the market. The *roughs* from the second row of bars are placed under a stream of water to clean the ore from all extraneous matter, so that the copper ore may, from its colour, be readily distinguished from the refuse, which is easily separated by what is termed *hand picking*, an operation conducted by girls who sit on tables near the stream. The picked ore by this operation is divided into *prills* and *dredge* and treated by the methods before described.

The *smalls* from the first operation are thrown on a gridle or sieve of holes  $\frac{1}{2}$  inch square; the coarse or larger particles which do not pass through, are subjected to precisely the same treatment as the *roughs*, and the fine and smaller particles, if rich are ready for the market; but if poor they are jigged through a sieve of holes  $\frac{1}{4}$  inch square preparatory to sampling.

The *prills* and *smalls* are then carefully mixed together into one pile or parcel, the *dredge* usually forming a separate parcel. The pile is then equally divided into 4 or 6 sub piles, or *doles*, the number being regulated by the weight of the parcel; if above 20 tons it is divided into 6 *doles*, and if below that weight into 4 only. This division into *doles* is effected by means of a measure called a *barrow* which when exactly filled with the ore weighs about  $1\frac{1}{2}$  cwt., the number of *barrows* is carefully noticed, and, the exact weight of one being ascertained, a rough estimate of the total weight of the parcel can then be arrived at for the ticketing or sale.

**SEPARATING SILVER FROM LEAD.**—The Nevada Transcript says that the Messrs Cassamayo, formerly of Nevada, have discovered a process by which the silver can be separated from the lead at a trifling expense, and are busily engaged in arranging the machinery of their mill. Their ledge is very rich in silver, but being mixed with lead has proven unprofitable, owing to the heavy expense of separating it. The ledge and mill are in close proximity to each other, and are situated about one mile and a half north-west of Washoe.

## A NEW INFLAMMABLE GAS.

Every new discovery in science, which it extends the dominion of useful knowledge, also offers up wider and grander prospects for future explorations. Rapid as have been the recent advances in chemical science; great as are the triumphs already due to researches in this direction, still, how little is actually known of Nature's grand operations! Scarcely a scientific journal comes to us from the East that does not contain something new in the interesting science of Chemistry. The following account of an important discovery, recently announced, may be the entering wedge which will open up some other of Nature's deepest mysteries. We quote from the "London Journal of Gas Lighting."

At a late meeting of the Chemical Society, Mr. Parrett stated that, some time ago, while Messrs. Buff & Wohler were making some experiments upon electrolytic decomposition, they employed a plate of the metal aluminium as the negative terminal of the battery for the decomposition of water and, as soon as the electric current was established, they were surprised to find that, instead of pure hydrogen gas being evolved, as is usual with a platinum plate, a gas was evolved which inflamed spontaneously. Upon investigation, this was found to be composed of hydrogen and silicon, the latter being an impurity in the aluminium plate. Several processes have recently been adopted for preparing this gas. Silicated hydrogen and silicate of magnesium were found to furnish the best materials for producing it. Dr. Hofmann recommends the following mode of making it: Take 80 parts of fused chloride of magnesium, 70 parts of silicofluoride of potassium, 40 parts of sodium cut into small pieces, and 20 parts each of the chloride of potassium and sodium. These ingredients are mixed together dry, placed in a crucible, and quickly heated to redness. The product thus obtained is a silicate of magnesia ( $Mg_2 Si$ ). When this is triturated in a mortar with hydrochloric (muriatic) acid, it gives off an abundance of gas, which keeps up a lively combustion in the mortar. A bottleful of this gas, prepared by Dr. Hofmann, was let off by a tube, through a trough containing dilute hydrochloric acid, and, as it escaped in bubbles at the surface of the liquid, these inflamed immediately and spontaneously when they came in contact with the atmosphere. Each bubble produced a white flame, like that of phosphoretted hydrogen. The combustion formed flakes of silica, which resembled fumes of burning zinc. This is one of the most dangerous gasses, and further investigation may prove that many mysterious fires, directly attributed to spontaneous combustion, may be due to it. Dr. Hofmann believes it is a marsh gas, of the silicon series.

**SPONTANEOUS COMBUSTION.**—A shaft has been sunk on the Home Ledge (copper) adjacent to the Alabaster Cave, in El Dorado county, to the depth of sixty feet, where a vein of copper sulphurets has been struck. When these sulphurets are raised to the surface, and exposed in the upper air about twenty-four hours combustion ensues, and the residuum resembles lava. The cause of the combustion has not been yet ascertained. The matter will be investigated by Prof. Whitney, State Geologist.

**COPPER FROM THE SOUTH.**—Some very rich samples of copper ore from the recently discovered mines in the Bill Williams' Fork District, New Mexico, were brought to this city by parties who recently arrived on the Steamer Senator.

**SANTA CLARA COLLEGE.**—We have received the "Prospectus" of this Collegiate Institute, containing a Catalogue of the Officers and Students for the year 1862—63; also the exercises of the 12th annual Commencement and the distribution of Premiums. The pamphlet also contains two beautiful lithographic views of the College.

**ST. IGNATIUS COLLEGE.**—The annual commencement of St. Ignatius College, of this city, takes place to-morrow. We acknowledge the reception of an invitation to be present at the exercises.

**THE HEIGHT OF VANDALISM.**—Some miserable wretch, has cut the stalk from the beautiful flowering shrub in the Custom House Park. Mr. Sanford has offered a reward of \$50, for the detection of the scoundrel.

## THE MINING SHARE MARKET.

The material improvement in the Mining Share Market, noted in our last issue, has, during the last six days, culminated in a perfect fever of excitement. The continued developments in the Gould & Curry, and the strike in the Hale & Norcross, has produced a most remarkable effect upon the shares of all companies on or near the line of the Comstock Ledge.

Gould & Curry advanced to \$6,300 early in the week, but subsequently declined to the same figure with which it closed the week previous—\$6,050. A dividend of \$150 per foot was declared on Friday—\$60,000 or \$50 per foot being carried forward to the coming month. The total amount of dividends was \$180,000. There is good reason for believing that the total earnings of this Company, for the coming year, over and above expenses, will exceed two and a half millions of dollars. The entire extent of the Company's ground is only 1200 feet.

Ophir Shares have been largely in demand during the week; 498 shares having changed hands at from \$2430 @ \$2700 per foot.

Savage has fully maintained its extraordinary advance of last week. The transactions in these shares have not been large, owing to the firmness of holders. This Company is now taking out large amounts of bullion, and a dividend is confidently expected the coming month. The receipts, for the present month, from the mine, are estimated at \$50,000.

Hale & Norcross has attracted considerable attention, at prices greatly fluctuating. 111 shares have changed hands at \$1600 @ \$2250. The market for the week opened at \$1600, advanced to \$2050, receded to 1700, again advanced to \$2250, and finally closed the week at \$2100.

Daney has also attracted considerable attention, with large transactions, at rates, quite uniform for an excitable market. Shares to the number of 313 have changed hands at \$352½ @ \$365.

Chollar has been sought for at rates ranging from \$740 @ \$1000. These shares experienced some little fluctuation but closed firm at \$900. The recent assessment of \$72 per foot has been made to effect a thorough opening of the claim. There is no apparent reason why this claim should not prove equally as valuable as the average of other ground on the Comstock lead.

Potosi has materially improved, though with limited transactions. It closed firm at \$700, an advance of \$200 over last week's quotations. The prospect of this mine is said to be highly satisfactory.

Wide West has seriously declined; opened at \$180 and fell to \$115, with a weak market, at the close. Silver Hill, transactions limited, at \$35. Antelope, \$225. Utah, \$85. Bamboo, but little dealt in. Pond, fell to \$20.

FROM HUMBOLDT we learn that prospecting is being done, generally with encouraging results, and extensive work is being performed on many of the old and recent discoveries. We have a table of Humboldt Mining Stocks, in course of preparation, which we hope to be able to give soon.

The last number of the Humboldt Register says that work is progressing finely on most of the old locations. The Manitowoc, Peru, Monitor, Sargent, Delirio, National, Alto, etc., all holding at good figures; and sales this week to thirty or forty thousand dollars. The highest offer we have heard for any was sixty dollars a share for Logan, on the Manitowoc ledge. Fall's mill has been running this week on rock from the National. Amalgamating now, and will commence immediately on Mars. No figures.

## THE COPPER INTEREST.

There is no apparent abatement in the Copper interest. Shipments are constantly being sent forward from the Calaveras and Amador mines.

Napoleon is now shipping an average of 6 tons per day, besides accumulating large quantities of 2nd and 3d quality ore for concentration. The stock of this company is held at prices largely in advance of buyers views. We notice no transactions during the week.

The Josaphine is driving up a working adit to their vein, which they hope to reach during the coming month. The work is being prosecuted night and day.

New and important developments are being made in that

portion of the Newton District, adjacent to the Mokelumne river on the south, and near Campo Seco. A new town has been laid out there, called Copper Centre. The principal Company is known as the Bull Run, which has a very promising ledge. They are now raising ore, having recently put up hoisting works, assorting sheds, etc. Quite a number of other Companies are operating in the same neighborhood, from whom we expect to hear good reports in due time.

The Newton Company has commenced sinking a new shaft, in order to secure a proper degree of ventilation for their mine. Work has been temporarily suspended in the old working by reason of foul air.

Knowledge of the Copper belt is being constantly extended northward. We hear of late and important developments in Yuba and Butte counties. An important discovery of Blue Malachite has recently been made near Oroville, which is pronounced by competent judges, in this city, as presenting the most promising indications yet developed in the way of Copper Mining.

The Eureka Co., Green Ledge, Nevada County, has ten tons of ore now on the way to this city, the first shipment from that county.

Considerable attention is beginning to be directed to Copper on the Eastern Slope. That region is undoubtedly rich in this mineral, and the prospect of the early establishment of railroad communication across the mountains, gives encouragement to immediate and thorough development of these mines, hitherto considered valueless for present working.

#### ESMERALDA CORRESPONDENCE.

The various Ledges in Esmeralda District are being more thoroughly worked than at any period since the discovery of the mines—the result of which has caused considerable activity in stocks the past week.

The Red, White and Blue, on Silver Hill, is turning out very rich rock. The old shaft is down to a depth of 70 ft. A second shaft has been sunk to a depth of 40 feet and the ledge is now over 8 feet wide. About 30 tons of rock has been taken out ready for crushing, which will pay from \$40 to \$60 per ton—the work is being vigorously prosecuted and from 8 to 10 tons per day is being taken out.

The Clan-Alpine on Last Chance Hill is yielding rich rock. The shaft is down to a depth of 30 feet and the ledge is 4 feet wide. About fifteen tons of rock have been taken out, which pays over \$100 per ton.

The last crushing from the "Ural" yielded 852 ounces. Fourteen tons from the Midnight paid \$1950. A crushing of 35 tons from the "Western Summit" yielded \$2400.

Twenty-two tons from the "Crockett" yielded \$3200. The last crushing of thirteen tons from the "Broderick" paid \$1350.

There is more rock being taken out at the present time than can be crushed by the various Mills in the District.

**SUBSCRIBE.**—Are you a miner and not a subscriber to the MINING AND SCIENTIFIC PRESS? If so, you are an annual loser of many times the price of a year's subscription, particularly if you are engaged in quartz mining. The same amount of practical information, important to miners and mechanics, which is contained in a volume of the PRESS, cannot be bought from the shelves of any bookstore in the country for the price of several years' subscription. Do you ever send a paper to the "Old Folks at Home?" If so, and you desire to send important information and valuable reading matter, you can find no paper that will be read with so much eagerness by them, or one that will convey to them so full an account of the real industry of the country as the MINING AND SCIENTIFIC PRESS. We invite all to send us their names and four dollars, or two dollars for six months, and become patrons of the only mining paper printed on the Pacific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examination, and with the hope that it may so for meet with their approval as to warrant their subscribing for it at once. It is not our usual custom to receive a subscriber for less than six months; but inasmuch as we are anxious to introduce the paper where it is not now known, we will, for the present, send the PRESS for three months even, on the receipt of one dollar, in coin or stamps. It is our belief that no one will wish to discontinue the paper after being a constant reader of it for even that short period.

### GENERAL MINING STOCK REPORT.

#### REMARKS

Considerable activity has been manifested in the Stock Market of Esmeralda District, the past few days, and a number of claims have changed hands at an advanced figure.

Ten thousand five hundred ounces (10,500 oz.) of bullion has been shipped from this District within the past four days and the amount in preparation for the next ten days will far exceed that figure.

#### THEATRICALS.

**McGUIRE'S OPERA HOUSE.** At this place the week has been chiefly occupied with East Lynn, one of those intensely sensational pieces, which at times arrest and absorb the public interest. Considering the painful moral of the play, it may, perhaps, be considered an indication of the improved taste of our citizens, to find the house crowded every night to its utmost capacity. Apart from the merits of the piece, however, the performance has been excellent, all exerting themselves to justify the patronage, so liberally extended by the intelligence and respectability of the city. So far as we catch the expression of public opinion, it is one of entire satisfaction, particularly with Mrs. Hayne, Mrs. Perry, Mrs. Mowbray, Messrs Taylor, Anderson, Mayo and Thorne. No doubt the Management are equally satisfied. On Friday, Mayo, and Saturday, Mrs. Hayne, took their benefits.

**EUREKA.**—At this little temple of fun, there has been no thing especially new since our last issue, except the burlesque Opera of "Oh Hush," in which the peculiar talents of the troupe appear to advantage. The singing and performance, as usual, have been good, and the house crowded to excess. We shall endeavor to aid this success; for the minstrels, in every respect, deserve the patronage they enjoy.

**DASHAWAY HALL.**—Do not forget the Histrionic and the Ball at this place to-night. Let those who can afford a dollar, go by all means, and we warrant they will not be disappointed.

#### VIRGINIA CITY STOCK LIST.

Corrected for the Mining and Scientific Press, Thursday, June 18, 1863.

**Pacific Mail Steamship Company.**

## NOTICE.

**ARRANGEMENTS HAVE BEEN MADE**  
by which shipments of

**Gold, Silver and Cop-  
per Ores**

can be forwarded under through Bills of Lading from  
San Francisco to England, at reasonable rates. For fur-  
ther particulars apply to

**A. B. FORBES, Agent,**  
284f Corner Sacramento and Leidesdorff streets.

**Miners' Foundry**

—AND—

**MACHINE WORKS,**

**First St., between Howard & Folsom,**  
SAN FRANCISCO.

**EVERY DESCRIPTION OF IRON AND BRASS MACHINERY,** the Best and Most Economical, manufactured  
in the State of California, will be furnished with dis-  
patch at the Miners' Foundry and Machine Works, as:

Steam Engines and Boilers, Flower, Saw and Quartz  
mill machinery, Mining Pumps, Amalgamators, Retorts,  
Etc., Etc., Etc.

Particular attention will be given to the manufacture  
of Machinery in Sections, designed for places of difficult  
access. Various models of Quartz Crushers, Amalgam-  
ators and Water Wheels—some in operation and on exhi-  
bition.

\* Parties desiring to test their ores practically, in  
small quantities will be afforded ample facilities, free of  
cost.

All parties desiring accurate and highly finished draw-  
ings and Superior Machinery, at most reasonable rates  
are cordially invited to call before contracting elsewhere

**HOWLAND, ANGEL & KING**  
San Francisco, February 23, 1863.

**W. BOHM, INVENTOR & PATENTEE**

**THE SUBSCRIBER HAVING OBTAINED LETTERS PAT-  
ent from Washington for an improvement in the**  
construction of Ladies' Buckles, is now ready to fur-  
nish the same in every variety of style. This buckle  
possesses several very important improvements over any  
other in use.

The invention having been carefully examined at the  
Patent Office, has been adjudged to be a useful improve-  
ment, and Letters Patent have been granted for 17 years.  
It excels all other buckles in  
**Usefulness, Strength and Appearance.**

The Public is respectfully invited to call and examine  
this Buckle at the Jewelry Establishment of

**BRAVERMAN & LEVY,**  
621 Washington Street, San Francisco.  
**JOSEPH, BROTHERS,**  
607 Montgomery Street, San Francisco.  
**FLOBERG & CONRAD,**  
118 I Street, Sacramento.  
Agents for the Patentee.

Every Buckle sold will be guaranteed as to its Strength  
and Durability. **W. BOHM, Patentee.**

### Gird's Budding Knife.

**THE ATTENTION OF FARMERS, HORTICULTURISTS**  
and Cutlers, or manufacturers of Horticultural  
implements, are referred to the above invention. For  
description and engraving see **MINING AND SCIENTIFIC**  
**PRESS** No. 24, vol. v.

State, Territory and workshop rights for sale at reason-  
able prices.  
Address, Publishers of Mining & Scientific Press,

**JAMES PHELAN,**

(LATE J. & M. PHELAN.)

**IMPORTER AND JOBBER,**

**Wines, Liquors, Etc., Etc.,**  
Nos. 616 & 618 Front street,

**P. DONAHUE, H. J. BOOTH, C. S. HIGGINS.**

**UNION**  
**IRON AND BRASS FOUNDRY.**

(The First Established in the State.)

CORNER OF FIRST AND MISSION STREETS, SAN FRANCISCO.

**HAVING ADDED TO THE SEVERAL**  
Departments all the recently improved Tools, this  
Establishment is now the most Extensive and Complete  
of any on the Pacific Coast.

The undersigned are prepared to furnish, at short no-  
tice, Locomotive, Marine and Stationary Engines, of ev-  
ery size and description.

### BOILERS.

Locomotive, Fine, Tubular, Upright and Cylinder, fur-  
nished with or without engines, complete.  
Machinery and Castings of every description, Saw-  
mills, Grist Mills, Car Wheels, Derrick Irons, etc.

**QUARTZ CRUSHING BATTERIES,**  
Embracing a great variety of Stamp, Mortar and Cam  
Patterns.

**AMALGAMATING MACHINERY,**  
Varney's Improved Patent Pans and Settlers, Wakely  
Pans, Amalgamating Tubs, Plaisied's Grinders, Chile  
Mills, Concentrators, etc., etc.

### MINING PUMPS.

Cornish, Lift and Force Pumps, from four to  
eight feet stroke, with Pipes, Bob Mountings, and Gear-  
ing complete.

### HOISTING DRUMS.

For Shafts or Inclines, with clutch, friction or V cone S  
Sole Agents and Manufacturers for the Pacific Coast, O.  
C. and G. M. Woodward's Celebrated Patent Safety  
Steam Pumps and Fire Engines.

All Contracts and Orders executed with promptness  
and dispatch, and at reduced prices for Cash.  
je21 **DONAHUE, BOOTH, & CO.**

### Giffards Injectors,

**FOR SUPPLYING BOILERS WITH FEED WATER**  
without Pumps No Mill or Mining Company  
should be without one of these valuable Instruments.  
Send for a Circular.

**DAVID STODDART, Agent,**  
je22 Cor. Pine and Front Sts., San Francisco.

**I. C. E. KLEPZIG & CO.,**

**GUN MAKERS,**

....AND....

**DEALERS IN GUN MATERIALS,**

**733 Washington street, San Francisco,**  
[One Door above Kearney street.]

Repairing done in a workmanlike manner at the short-  
est notice.

Gilding, and also Silver Plating, by E. Eklund. je21

### CORNELL'S

**EXCELSIOR GALLERY,**

**650 Washington st. Three doors below  
Kearny.**

Having refitted the above rooms the undersigned is  
now prepared to furnish the public with a superior style  
of Picture, at a lower price than ever before offered in  
the city.

### CARD PICTURES.

As I have every facility for producing these beautiful  
pictures, in all their different varieties, I have reduced  
the price to

**\$3 PER DOZEN and \$2 PER HALF DOZEN!**  
Large size Photographs. \$3.—Extra copies \$1 each.  
**AMEROTYPES** in all Styles and Prices.

**OLD PICTURES** copied with care and accuracy, in any  
style desired, Particular attention paid to pictures of  
Children.

Pictures painted in Oil or Water Colors, and retouched  
in India Ink by a competent artist.

je22 **R. H. CORNELL.**

**BAUNCHEIDTISM,**

**THE PRESERVER AND PRODUCER OF LIFE.**

**THE EFFECT OF BAUNCHEIDTISM AS A METHOD OF**  
curing disease, is a "fait accompli" in medicine,  
and needs no more proof. The public has crowned Baun-  
cheidism already with an extraordinary patronage, and  
it is acknowledged by all men of science that BAUN-  
cheidism is founded on a rational, scientific basis.

It can safely, and with sure success be applied to pa-  
ralysis in consequence of Apoplexy, Podagra and Rheu-  
matism of every description, which kind of complaints  
can find their only relief by the above method.

Especially can it be applied successfully, in the spring  
of the year to diseases of the eye.

Dr. Borchers in San Francisco, and Dr. C. J. Marx in  
Sacramento, are the only doctors in California who have  
the original series of Dr. BAUNCHEIDT and his original  
oil. Dr. Borchers is also in possession of original letters  
of the inventor of the method by which he can prove that  
he is the best method of the latter.

**DR. J. C. BORCHERS.**  
No. 19 Kearney street, and No. 4, Mark's Place. First  
story. No. 5. Office hours from 9 to 11 A. M., and 1 to  
4, and 7 to 9 T. M. je-21

**P. M. S. CO.**

**PACIFIC MAIL STEAMSHIP COMPANY'S**  
line to PANAMA, connecting via the Panama Rail-  
road with the steamers of the Atlantic and Pacific  
Steamship Company at Aspinwall.

**FOR PANAMA.**

The following Steamships will be dispatched in the  
month of May, 1863.

**July 3d, - - - - - Stermer Golden Age**

**July 13th, - - - - - Steamer St. Louis**

**July 23d, - - - - - Steamer Constitution**

Will leave Folsom Street Wharf, with Passengers and  
Treasure, for Panama

AT 9 O'CLOCK, A. M., PUNCTUALLY,

And connect, via Panama Railroad, at Aspinwall, with  
steamships for New York.

For Freight or passage, apply to

**A. B. FORBES, Agent.**  
je4 Corner of Sacramento and Leidesdorff sts.

## WHEELER'S

**Amalgamating and Separating Pans.**

It is acknowledged by all who have examined the prin-  
ciples and witnessed the operation of these Pans, that  
they are decidedly superior for triturating and amalga-  
mating purposes to any other in use.

The most important principle connected with the op-  
eration of these Pans is the separation of the triturating  
process from that of extracting the amalgam from the  
sand. The chief cause of loss of the precious metals ar-  
ises from the passing off of the same in combination with  
the quicksilver, during the process of triturating, and in  
cleaning up. By the introduction of the Separating Pan  
to flow the triturating this loss is entirely avoided. In  
working these machines there is no appreciable loss of  
quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated  
on the side of others on sands from the same vat, the  
Wheeler Pans have uniformly gained a large percentage  
of metals over its competitors, as well as a still larger  
percentage in the amount of work performed.

\* These Pans have been seen in daily operation, at the  
Miner's Foundry, on First street in this city, where all  
interested are invited to call and examine for themselves.  
2016-H **ZENAS WHEELER.**

**A. ROMAN & Co.,**

WHOLESALE AND RETAIL

**Book Establishment,**

### Steen's Improved Governor

Is the CHEAPEST, SIMPLEST and QUICKEST to act  
and least liable to get out of order of any Governor in  
use. It can be seen in operation at the Golden State Iron  
Works, and at the Stone Breaker, foot of Market Street,  
San Francisco.

### Clark's Steam and Fire Regulator,

For controlling the Draft or Blast by opening the Chim-  
ney or Valve in the Blast Pipe by the pressure of the  
steam in the boiler. It will regulate the pressure to a  
pound, on the square inch. IT CANNOT get out of order  
and any person can put one up in an hour after the dam-  
per is put in.

### Ingersolls Patent Drill Press,

With which drilling can be done the same as with the  
common ratchet, and when small holes are wanted, it  
can be done four times as fast. The handle can be wor-  
ked in any direction.

### Felt for Steam Boilers, Pipes, Etc.

At the lowest market rates.

### Steam Engines, Boilers, Pipes,

Hydraulic Presses, Shafting, Pulleys, Etc., at the lowest  
market rates.

### Anti Incrustation Powder,

A Sure Remedy for Scale in Steam Boilers, without injury  
to the iron. In use for the past EIGHT years.

Refer to—Sugar Refinery, San Francisco,  
Cottell & Co., San Jose,  
L. A. Booth, Esq., Virginia City,  
and 2,000 others in the United States.

**E. T. STEEN AGENT.**

No. 33 Fremont Street, San Francisco.

## MINING & SCIENTIFIC PRESS.

**THE ONLY MINING, MECHANICAL AND  
SCIENTIFIC PAPER ON THIS  
CONTINENT.**

**THIRD YEAR! VOLUME VI.—NEW SERIES!**

A new volume of this extensively circulated paper  
commenced Sept. 11, 1862. It is intended that every  
number shall be replete with information concerning  
Mining, Scientific, Mechanical and Industrial pursuits,  
together with several original engravings, of new inven-  
tions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together  
with the interests of Science, Arts, Agriculture and Com-  
merce, and any general information that may be of in-  
terest to the reader; and it is the intention of the pro-  
prietor to spare no pains or expense in making it equal  
in interest and valuable information to any paper yet  
published.

### The Mining Interest!

Will find it of great value, as it will contain all the  
news appertaining to Mining, the prices and sales of  
Mining Stocks, new inventions of Machinery adapted to that  
purpose, and of everything generally that may be of ser-  
vice to the Miner.

### The Inventor!

Will find it an excellent medium for the purpose of  
bringing his invention into notice, of ascertaining the  
progress of invention in this and other countries, and  
also of receiving any information that may be neces-  
sary in obtaining his patent, the proprietors having had  
great experience as Patent Agents, together with facili-  
ties at Washington that enable them to obtain Patents  
with dispatch.

### The Mechanic and Manufacturer!

Will be greatly benefited by its personal, as its col-  
umns will from time to time contain original engrav-  
ings of new machines and inventions, together with a  
large amount of reading matter appertaining thereto.  
We are constantly receiving the best scientific jour-  
nals from all quarters, from which we shall continue  
to extract whatever may be of benefit or interest to  
our readers.

### To Chemists, Architects and Millwrights.

This journal will be invaluable. All new discoveries  
in Chemistry will be given, and a large amount of infor-  
mation of great service to Architects and Millwrights  
will be found in our columns. The Farmers and Plau-  
ters will not be neglected, engravings will be given of  
agricultural implements, and the farming interest gen-  
erally will be amply discussed.

### Terms.

To mail subscribers—Four Dollars per annum

**Club Rates.**

Five Copies for Six Months, \$8.

Ten Copies for Six Months, \$16.

Ten Copies for Twelve Months, \$30.

Fifteen Copies for Twelve Months, \$44.

Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscrip-  
tion is only \$2 80. Names can be sent in at differ-  
ent times and from different Post-offices. Specimen  
copies will be sent gratis to any part of the country.  
**EWER & SMITH, Publishers.**  
Room 27, (formerly U. S. Court Building, Corner of  
Washington and Battery streets, San Francisco.

Patent spring Bed and Hair mattresses. The International  
offers to guests the greatest number and**

**BEST FURNISHED FAMILY ROOMS;**  
and SEVEN AN GOOD A TABLE as any House in the City.  
I am determined that the INTERNATIONAL shall be the  
most comfortable, best regulated, and in all respects su-  
perior to any like establishment in the state, and shall  
aim to merit a continuance of the popular favor it has  
enjoyed heretofore. It will be conducted on Temperance  
Principles.  
F. E. WEYGANT, PROPRIETOR.

**Tremont House,**  
418 and 420 ----- Jackson Street,  
[A few doors from Montgomery.] SAN FRANCISCO, CAL.

**THIS FINE, FIRE-PROOF BUILDING OFFERS MANY  
advantages to the traveler for convenience. It is  
only half a block from the Post Office and Custom House,  
and about the same distance from the principal places of  
Amusement.**

**The City Railroad Cars pass the Door.**

The House is conducted on Temperance Principles,  
**WHICH SECURES TO OUR GUESTS QUIET.**

The prices for board and Rooms are very moderate—  
by the day, meal or week. WE SOLICIT A CALL FROM ALL.  
F. E. WEYGANT, Proprietor.

For the accommodation of my many guests I have ta-  
ken and refurnished the INTERNATIONAL Hotel, and will  
carry on the two houses in connection, so that Travelers  
wishing to put up at either house, may take the Tremont,  
or International Hotel Coach and be taken to either House  
with their baggage, FREE.  
F. E. WEYGANT.

**Volcanic Smelting Furnace.**

**PERSONS DESIRING INFORMATION AS TO THE USE  
and economical properties of this Furnace, and in-  
cluding to make use of the same, when satisfied of its  
superiority over all other means of reducing ores and  
separating metals from the sulphurets, can obtain all  
needed explanation and advice in regard to the same, and  
the terms of sale of rights to use the same, on application  
Col. J. D. Stevenson or T. Ogg Shaw, or by letter to the  
proprietors through the Post Office at San Francisco.  
Drawings may be seen at the office of Col. J. D. Stevenson,  
No. 614 Merchant street, or at the office of T. Ogg Shaw,  
in Brannan's Building, Montgomery street.**

The time required for reducing ores by this Furnace  
is from three to eight hours, and the amount of fuel only  
one-tenth as much as is consumed by other processes.

The process of condensation is applied to this Furnace  
which will save all those portions of precious metals  
which usually escape in a volatile form.  
The attention of all interested in the subject is requested  
to examine the important results obtained by this pro-  
cess.

Parties wishing will be allowed to erect a trial Fur-  
nace of capacity for smelting one ton of ore or more, on  
signing an obligation to pay the usual fee for the right to  
use it, should they continue to make use of the invention  
or a longer period than two months.  
mch 16 MRS. E. J. HALL, M.D., Proprietress.

and Jackson streets, SAN FRANCISCO.

**Manufacturers of Fire Proof Doors and  
Shutters, Bank Vaults, Grating, Cemetery Rail-  
ings. All orders from the interior Oregon, Washington  
Territory, Vancouver's Island, British Columbia, or any  
place on the Pacific coast, attended to with promptness  
and dispatch.**

**Mr. Sims Appreciates the Past**  
liberal patronage of his friends, and trusts that he may  
continue to merit it in the future.

**For the Information of Strangers**  
he would say that he feels confident that his experi-  
ence in his particular calling is surpassed by none on  
this coast, which his superior work, sent to almost ev-  
ery town in this state, Oregon, also Victoria and the Sand-  
wich Islands, and to be seen on some of the best build-  
ings in San Francisco, fully attest. A large assortment  
of second hand shutters for sale at low rates. ap13

**NATHANIEL GRAY,**  
**General Furnishing Undertaker,**  
641 Sacramento st., Cor. of Webb,  
SAN FRANCISCO.

**FULTON FOUNDRY & IRON WORKS**

**HINCKLEY & CO.,**  
MANUFACTURERS OF  
**Steam Engines,**  
QUARTZ, FLOUR AND SAW MILLS; CAST IRON  
FRONTS, FOR BUILDINGS, MINING PUMPS,  
AND ALL KINDS OF MACHINERY, ETC.,  
FIRST STREET,  
BETWEEN MARKET AND MISSION.....SAN FRANCISCO.

\* \* All kinds of IRON AND BRASS CASTINGS furnished  
at short notice. Every style of FINISHING to Iron when  
cast. Repairing of Machinery neatly done.  
PATTERN MAKING in all its various forms. Prices low.  
D. B. HINCKLEY. WM. E. WORTH. WM. A. FIELD.

**W. T. & J. GARRATT,**  
**City Brass and Bell Founders**  
Cor. First & Market sts., San Francisco.

**BABBIT METAL CASTINGS, FIRE ENGINES, FORCE  
and Lift Pumps, Church and Steamboat Bells, Tav-  
ern and Hand Bells and Gongs, Hoses and all other joints,  
Gauge cocks, Cylinder cocks, Oil Globes, Steam Whistles,  
HYDRAULIC PIPES AND NOZZLES for MINING PUR-  
POSES, Iron steam pipe furnished with fittings, &c.;  
COUPLING JOINTS OF ALL SIZES. Manufacturers of "Gar-  
ratt's Patent Improved Journal Metal."**

**SQUARZA'S PUNCH.**  
FIRST PREMIUM  
AT THE SACRAMENTO AGRICULTURAL STATE FAIR  
FOR 1862.

ALSO; FIRST PREMIUM  
At the San Francisco Bay District Agricultural Fair, 1862  
MANUFACTORY, WHOLESALE AND RETAIL,  
No. 44 Leidsdorff street,  
Opposite the What Cheer House, San Francisco.

**To Mine Owners.**  
**PARTIES having a Good silver Mine**  
and wishing for  
Machinery to work it for an interest in the Mine  
Will do well to apply at this office. No organized com-  
pany need apply.

**50 lbs. MARINE and  
Fire-Proof Paint,**  
MANUFACTURED BY THE PACIFIC METALLURGICAL  
Works in this city, for Hulls and Decks of Vessels,  
from ground Mineral Rock contains Arsenic, Copper, Li-  
tharge and six other Minerals. When used on the Decks  
or Bottoms of Ships, it is equal to a coat of Stone, and  
quite equal to Copper, no worms will ever effect it, and  
cheaper than any other paint.

**DIRECTIONS:**  
For Decks of Ships, use two parts Mineral Paint, one  
part White Lead, mix with Linseed Oil.  
For Bottoms of Vessels, use one part ground sulphur  
three parts Mineral Paint, mix with Coal Tar and apply  
it hot.  
For sale by all Ship Chandlers and Tradesmen, in boxes  
of 50 lbs. each, or by the Pacific Metallurgical Works.

**25 POUNDS FIRE-PROOF PAINT.**  
When used on Roofs, Buildings, or Fences, it is equal  
to covering them with a coat of Stone, being perfectly  
Fire Proof, and costing less than any paint.

**DIRECTIONS:**  
HOUSE.—Mix three parts Mineral Paint with one part  
white lead, thin with Linseed oil: if a lighter color is  
wanted, mix less paint, more lead.  
ROOF.—Five parts of Mineral Paint, one part white  
Lead; mix with Linseed oil. Put it thick on a tin Roo  
as one coat when properly applied will last three years.

## THE BRYAN BATTERY.

The vast interest involved in the reduction of ores on this coast, renders it of the highest importance that the Machinery employed for this purpose should be of the most Effective, Economical and Durable Character. It may be safely said that Millions of Dollars have already been wasted upon the various experiments in this class of Machinery, and it is a fact well known to all who have had any practical experience in the matter, that every new process developed during the last twelve years, has been set down as a failure. The Ordinary Stamp Battery

### ALONE STANDING THE TEST.

This, with the Improvements which Experience has suggested, is now regarded, by common consent, as the only reliable

### METHOD OF CRUSHING ORE.

THE BRYAN BATTERY, as now constructed, is believed to combine all the improvements which the experience of the past has afforded. They have been

### EXCLUSIVELY ADOPTED

by many of the most prominent Mining Companies in the country, and have been, for the three past years, subjected to the severest of all test—that of constant use—and in every case has been pronounced

### EFFECTIVE, SUBSTANTIAL AND RELIABLE.

They are now pretty extensively used throughout the mineral regions of California, Nevada and Mexico, and have established a claim to public confidence, never yet equalled in any piece of machinery.

These Mills are constructed almost entirely of Iron, and, consequently, are not affected by the intense heat and dryness of atmosphere, common to all mining localities. They are adapted to

### BOTH WET AND DRY CRUSHING,

and are warranted to reduce, with the same weight of stamps, 25 per cent, more rock than any other mill in use. Each Battery is complete in itself, and forms a perfect mill—while any number of them can be added at a subsequent time—thus preserving the symmetry and uniformity of the Mill

As an evidence of the increasing favor with which these mills are regarded, we would mention that the Celebrated Ophir Company first introduced them into their works in 1860, and have been adding a number of Batteries, each subsequent year, until they now have Nineteen, running Seventy-six Stamps,

They are perfectly fitted and set up at our Works, before shipping, each piece being marked and numbered, so that they can be put up and set at work in ten hours after arriving on the ground. They are made of two sizes with four and five Stamps, etc. The Four Stamp Battery weighs, when complete, about 6,000 pounds, and the Five Stamp about 7,000. The Mortar Bed, when desired, is cast in sections, so that the mills can be packed over any mountain road.

We annex the names of a few well known Companies who have adopted them—running from four to seventy-five stamps each—to whom reference is made:

Ophir Mining Co., Washoe Valley,  
San Marcial Co., Mexico,

## CENTRIFUGAL QUARTZ CRUSHER.

The annexed cut represents the quartz crusher, of which we have frequently spoken, as in use at Pike's Peak, where it appears to be known as the "Young America Quartz Crusher." In the proprietor's Circular from which we gather the following description, it is called "The Centrifugal Quartz Crusher." It is employed at Pike's Peak in connection with Keith's Desulphurizing Process, for which it is peculiarly adapted.

It is claimed that this mill is capable of crushing a larger amount of material, with a less expenditure of power, than any other mill in use. It is said to be as well adapted to the grinding of all kinds of grain, as it is to the reduction of quartz rock. The engraving fully represents all the parts, a portion of the left side being broken away to exhibit the inside structure. The shell is three feet in diameter, and five inches wide; a steel shaft passes through the centre, armed with six fans or arms, reaching nearly to the periphery or rim, which is corrugated on its inner side. The material to be crushed is thrown in alongside the shaft and has its exit on the opposite side, through the pipe there presented. Each piece of ore or other material, as received, is stricken by the arms, and rendered dust fine, in which condition it is thrown out at the tube on the opposite side by their action as a centrifugal blower. The fineness of the product, and the efficiency of the mill, depend entirely upon the velocity with which it is moved, and the position of the pipe for the exit of the ground material. At low velocity it is an excellent rice and coffee huller, and at high velocities the hardest gold quartz can be ground to an impalpable powder.

## ANALYSIS OF THE ACTION OF THE CENTRIFUGAL QUARTZ CRUSHER.

For a clear understanding of the action of this instrument, it will be necessary to analyse some of the natural laws which are brought into requisition during its use. The difference between absolute momentum and continued force, is well understood; but when the momentum is carried up to unusual speeds, it is claimed that new actions and functions are developed, which are not to be found in the trip hammer or other usual methods of exercising momentum. Suppose a piece of gold quartz to be thrown into the atmosphere, and during its descent be stricken by a sledge hammer, traveling at the rate of twenty thousand feet per minute; it is claimed that the action will not be merely to break the gold quartz into fragments, but to surmount the cohesive power of the mass, and thus, for an instant, of time, to do away with that property, rendering the mass representing smoke of finest possible division of matter. And this claim we think can be rendered understandable by a clear illustration of what constitutes cohesion, and also by a development of a new function, which may be thus expressed.

A body in motion, is said, in common mechanical parlance, to have a power, as a projectile, equal to its weight multiplied by its velocity." It may be said, with equal truth, that the hardness of a body in motion is equal to its hardness multiplied by its velocity. Thus, it is well known, that a

## Howell's Patent Centrifugal Quartz Crusher.

tallow candle may be thrown from a gun through an inch plank, while it is well known that a candle is much softer than a board. It is also well known, that a disc of soft iron rapidly revolved, will cut into a bar of steel; indeed, any substance, which from its surroundings and peculiar configuration, can be passed with great velocity, is increased in relative hardness. Let us admit, then, that with the Centrifugal Quartz Crusher the moving arms may be made to reach the velocity claimed as necessary to surmount cohesion. If we examine cohesion as a property in matter varying in different substances, and suppose it to arise from the attraction of particles for each other, rather than from a hooklike form of particles interlacing each other, we shall find no difficulty in comprehending the immense force necessary to sever it. Thus, a cubic inch of steel, or an inch square of steel, would be more proper in this case, exercises tension at the rate of 90,000 lbs. when applied as continued force, and not as a momentum. If we recollect the rule that attraction is inversely as the squares of the distances, and then admitting that with an ordinary magnet, the attraction exercised upon the keep, at the distance of one inch, is 1 lb, then at half an inch it will be 4 lbs, at a quarter of an inch 16 lbs, at an eighth of an inch 64 lbs, at the sixteenth of an inch 256 lbs, at the thirty-second of an inch the square inverse of that number, and so on at the same ratio, until at the point which is supposed to be actually in contact, it is no longer curious that the inch area should sustain 90,000 lbs, but rather that any amount of force which could be practically applied would draw it asunder, and were it not for that film of resistance described by Newton, it could not be separated.

When a surface is attacked by absolute momentum, this film of resistance may be perceived; and although in ordi-

nary use two billiard balls do not really touch each other and therefore the polish is not destroyed and the balls are not split, still with an increased amount of momentum both these effects will occur. As an illustration, suppose a polished anvil have placed upon it a piece of gold leaf, and you should put upon this any amount of continued force, it would not cause any amalgamation, or other connection between the gold and the anvil, and after removing the impinging matter the gold leaf might be blown off; but if the gold leaf be stricken by a polished hammer, so as to develop momentum at the point of contact, that point will be found to be permanently gilt, and if we scrape off the surface to three times the thickness of the gold leaf, we shall find gold imbuing the metal. This is a well known fact, and fairly illustrates that by absolute momentum the film of resistance may be pierced, and certain metals may be forced into each other.

Now in the use of the arms of this machine, we would claim that absolute momentum, and not continued force, is the form in which all power is developed at the speed proposed by the inventor. This momentum is sufficient, not only to do away with the film of resistance at the point of contact, but to surprise the cohesion of particles, so that instead of breaking the mass into many pieces, it absolutely divides it into its ultimate particles: and there is a speed at which chalcedony and gold quartz may be crushed by this machine, so that the powder resulting is so fine, that when rubbed between the fingers it is soft like velvet, exhibiting no grit or other proof of crystalline or other continuous structure; nor will the machine itself be abraded during their action, for so great is the speed of the arms giving the momentum, that their hardness, as before explained, is increased in the same ratio. Even the surface of these cuttings will not be abraded, while the substances they are impinged upon will be delivered from the machine in this finely divided condition.

All former methods of crushing gold quartz have failed in exhibiting all the gold, from the absence of an entire division, mechanically, of the particles. This may be understood: a piece of pure gold drawn across the surface of a hone leaves a yellow mark, and in many kinds of gold ores this graphitic-like mark is to be found percolating the mass, and when divided by washing, despite all methods yet pursued, it passes off with the water. Indeed, this finely divided gold will float a month on the surface of water, without becoming wet on the upper side of the particle, or in other words, without sinking, and it is therefore lost. Many specimens of gold quartz contain a much larger amount of gold than can be separated from them after what is usually called thorough grinding, by washing, and the same defects from the same reasons, occur during the attempted amalgamation. When the quartz, however, is crushed by this machine, at its greatest velocity of action, every graphitic indication of gold is caused to appear upon the surface of particles, and therefore it may be removed by ordinary amalgamation. We have seen ores crushed with this machine, which would yield a larger percentage of gold beyond the amount obtained by the usual methods, than the amount so obtained.

NOTES OF A TRIP TO SLATE RANGE *via* LOS ANGELOS AND EL PASO.—No. 4.

APRIL 25th. The El Paso range of mountains, for which the District is named, is a spur from the southern termination of the Sierra Nevadas, running north easterly about 25 miles from Red Rock Cañon, near Cane Springs, through which the road leads off to Owens Lake country, Coso, Mono and Esmeralda mining Districts. Another spur of burnt mountains commencing at the same Cañon, runs north-westerly to Walker's Pass, about 35 miles. The El Paso Range seems to contain rich metals, throughout its whole length, except at a point about 3 miles north of Mesquit Springs, where the hills appear to be entirely burned to ashes. Some gold has been found in these hills, but no defined ledges.

## THE MINERALS AND MINERAL VEINS.

The minerals found here are silver, copper, galena, and some gold; of which the Tucker Lode, on Gold Hill presents, thus far, the best indications, which are bright pieces of native metal seen all through the rock. The range seems to terminate in a mountain called Laurel Hill, which contains more rich lodes than any other in the District. The Manzannilla, Milliken, Laurel No. 1 and 2, and Ophir Lodes are located there. Thus far but very little work has been done in the District; no working men have come in. All are prospectors and locators. Many of the lodes show very rich croppings, and soon they will be further developed by sinking shafts, and tunnels, to find their condition 25 to 50 feet below the surface.

The lodes now located are generally boldly defined, some of them rising 5 to 8 feet above the surface, showing a continuous line of mineral for a long distance.

## ORE en route FOR SAN FRANCISCO.

A train of 30 pack-mules passed, from Slate Range, to-day, loaded with Antrim rock bound for San Francisco for reduction. The teamsters all say that this point may be considered the half-way station from Los Angeles to Slate Range, as from this Spring no feed or water can be found, together, to keep up the condition of the cattle. Teamsters offer to contract for freight to this place at one half the rate to Slate Range, although the distance from here to Slate Range, is only 50 miles; while to Los Angeles it is nearly 150 miles.

APRIL 28th. There is no difficulty in finding leads here, as they crop out on every hill and gulch. We shall locate some of them, and as soon as our tools arrive, develop them, to determine whether they will pay to work and ship to the city, at a cost of about \$125 per ton.

## A THUNDER STORM.

MAY 1st. A heavy thunder storm, with little rain, passed along the summit of the mountains, following the hill around to the East and then South Easterly on a spur into the desert about 40 miles. It was very interesting to one who had not heard the sound for more than 13 years.

MAY 4th. To-day we associated with a couple of prospectors, who have a pack-mule, and one of our party left with them for a week's trip to prospect Laurel Hill, from which some specimens of great value have come into camp.

## THE ILL FATED ADA HANCOCK.

Report came in to-day of the terrible accident occurring to the steamer Ada Hancock, on the 27th ult. This strikes home to our community with great force as we were intimately acquainted with most of those killed and some of them are associated in this mining enterprise, and were here only a few days since in full health.

MAY 5th. Made out and posted notices of a meeting of miners, for the 8th of June, to alter and amend the District Laws.

A party of 20 or more soldiers have arrived at Can Springs as escort to a train conveying Government stores to Owens Lake Country. They remain at the Springs till a former train returns to that point under guard and then return the way they came.

## PROSPECTORS AND LABORERS ARRIVING.

Our Recorder, J. Narboe, and others who left under the Indian excitement, have returned and are intending to progress vigorously with the work of developing the claims.

11th. Two Cornish miners came in to-day with a Visalia party. Messrs Turner, Cobb and Rheinstine, to open claims and test their value. Good for us!

Messrs. P. Banning of New San Pedro and M. Keller of Los Angeles, have sent out a working party of about 20 greasers and four or five white men, to work 15 or 20 claims, held by the original discoverers of this District, Messrs. Milliken, Narboe and Warner. Most of these claims are in Montville Cañon, Copper Hill and Basin Silver Hill and Gold Hill: They reserve their Laurel Hill leads for the present, I am told. Our population is now about fifty, including greasers.

15th. The greasers are leaving, as the work is very hard and the pay small—about \$25 per month and found. The climbing up to their work in the morning is what wears them out, as the camp must be located at the base where the water is found.

17th. Messrs. Keller & Co. are here again to look over the District and decide in regard to sending out more help.

WEDNESDAY, MAY 20th. For nearly three weeks, I have been almost alone, acting as camp keeper for three camps, close by, while all hands are busy among the rich lodes of Laurel Hill, 15 miles away.

I will send forward by first opportunity this fourth paper, and then others as occasion offers.

Report has come in of Mr. Whitmore and six horses missing from Indian wells ranch, supposed to have been taken by Indians. Two horses were shot and left on the ground.

I will make up a list of what is wanted for a prospecting trip like this, in my next letter. C. W. T.

## SUB MARINE EXPLORATIONS.

It is only within a few centuries that the inventive genius of man has been enabled to so far cope with the ordinary laws of Nature, as to remain for any length of time beneath the surface of the water. Curiosity at first prompted to such attempts, and subsequently the wants of man became powerful incentives to efforts in this direction. The limited powers of endurance on the part of the simple diver, soon called into action the inventive ingenuity of man to supply mechanical aids for such hazardous and laborious undertakings. Inverted wooden tubs, cumbrous with pendant weights and overhanging tackle, gradually gave way to metallic hemispheres, with various contrivances for supplying fresh air. Dr. Halley and Mr. Phipps, in the latter part of the 16th century, made various important improvements to the "Diving Bell," which greatly increased its practicability. The Doctor invented a very useful contrivance by which he was enabled to go out and move around upon *terra firma* at the bottom of the water. This last invention doubtless suggested the "Submarine Armor" which has been so popular for the past twenty years, and which has actually accomplished much in bringing to the surface sunken treasure, etc., and in conducting various other submarine operations.

Important as were the results achieved by these appliances in the hands of daring men, from the time of their earliest introduction up to near the close of the last decade, it was still acknowledged that much remained to be done to bring the diving bell to anything like a reasonable standard of excellence. The chief obstacles in the way of their advantageous application was the cumbersome machinery unavoidably attached to them, for forcing air, etc., and the necessity of sustaining them by derricks or cranes. The former objection was a most serious one and extremely hazardous, as the lives of the divers often depended upon very slender and uncertain appliances; while the necessity of being sustained by cranes rendered their employment upon floating supports almost useless from their constant up and down motion, where the water is agitated by any considerable wave or swell. The great danger to life, and terrible effect upon the system, attendant upon the employment of the submarine armor is well known to all conversant with submarine operations. The simple statement of the fact that in the use of the "armor" at a depth of 100 feet, every plunge of the air pump is equivalent to a blow nearly equal to four pounds upon each square inch of the body of the operator, is sufficient evidence of the endurance required in its use. No organization can successfully resist the exhausting effects of such terrible and continuous shocks for any considerable length of time.

The Diving Bell and Submarine Armor, have had their day. They have been weighed in the balance and found wanting, and the world is now indebted to an American In-

ventor for what appears to be the perfection of mechanic appliances to submarine operations, whether for descending to the bottom, remaining there at will, then ascending to the surface; or moving along beneath the surface, at a greater or less depth as may be desired.

The invention to which we now refer was patented by Professor RYERSON, of New York, about three years since, and was first successfully employed in removing the obstructions near Hurl Gate, in New York Harbor. It was then pronounced by the New York papers as the *ne plus ultra* in the way of a diving apparatus, and that opinion has never been qualified since.

We have now before us a sketch of this ingenious piece of mechanism with a description of its parts from which to condense:—

It is formed of two very substantial wrought-iron cylinders one of which is contained within the other. The space between them forms a compressed air chamber.

The inner cylinder is divided into two compartments, which can be completely separated from each other by closing the intervening man-hole whenever separation is necessary. Communications are maintained between these compartments and the compressed air-chamber by valves, or stop-cocks. At the base of the machine there is another compartment completely surrounding it called the ballast-chamber. It communicates both with the compressed air-chamber and the external water, by means of pipes and stop-cocks.

Into this ballast-chamber water or air may be admitted at pleasure by the workmen within the Bell, and the machine can ascend or descend; and the equilibrium is so nicely adjusted that it is absolutely impossible to upset the machine when it may rest only on one point of a rock. The air condensed into the compressed air-chamber at first, by ordinary force-pump, to the extent required previous to descent. The machine is now perfectly buoyant, but by ingenious arrangement, after the hatch is secured, water admitted into the ballast-chamber; the machine then sinks and after it has reached the bottom it remains ready for proposed work. This machine having reached the bottom to be explored or acted on, the man-hole between the two compartments is opened, and the workmen begin their operations in the lower working chamber, and can continue them without interruption, even for days, either in laying foundations of breakwaters, sea-walls, piers, in raising sunken vessels, treasure or anything valuable in them, in diving for pearls, and sponge. It has been suggested by experienced persons that this Bell is preeminently fitted for the exploration of the bottom of auriferous rivers in every part of the world. In short, this machine is applicable to every branch of submarine exploration. The light is partially admitted through bulls-eyes. Candles are required, and the combustion of these, together with the respiration and transpiration of the confined workmen, in due time vitiate the air contained in the chambers. To remove this air without external appliances was the great problem to be solved, and Mr. Ryerson triumphantly done so. By a very simple expedient the air is restored to perfect purity in a few minutes, not as in the previous machines by driving fresh air from above, but by driving (by means of a small forcing pump within the machine) through a very minutely drilled resette, resembling that of a common watering-pot, water from without, in the form of very fine spray or mist for some minutes.

By this simple and easy process, the carbonic acid and other noxious gases, formed by combustion &c., disappear. The previously vitiated air recovers its oxygen, and is found (as determined by a very careful analysis, given in another column,) to hold an excess of five per cent. more oxygen than that contained in the ordinary atmosphere. Thus Ryerson's machine can ascend and descend, always maintaining an equilibrium, purify its vitiated air without external connection or assistance, and is thus placed at the head of all submarine explorers.

POISON ANTIDOTE—SWEET OIL.—Says a farmer: "I have now over twenty years since I learned that sweet oil would cure the bite of a rattlesnake, not knowing that it would cure any other poison. Practice, observation and experience have taught me that it will cure poison of any kind, both in man and beast. I think no farmer should be without a bottle of it in the house. The patient must take a spoonful internally, and bathe the wound for a cure. To cure a horse it requires eight times as much as for a man. Here let me tell of one of the most extreme cases of snake-bite in this neighborhood, eleven years ago this summer, where the case had been over thirty days' standing, and the patient had been given up by his physicians. I heard of it, carried the oil, gave him one spoonful, and a cure was created. It is an antidote for arsenic and strychnine. It will cure bloat in cattle caused by eating too freely of fish clover; it will cure sting of bees, spiders, or other insects; and it will also cure persons who have been poisoned by ivy vine."

## THE CENTRIFUGAL QUARTZ CRUSHER.

The great interest manifested, and numerous enquiries made, by letter and otherwise, with regard to this Crusher, have induced us to give an illustration of the machine, on our first page, accompanied with a description, and a very full analysis of the philosophy of its operation. With regard to its capacity or practicability we know nothing except by hearsay, and that information, together with our authority, we have fully communicated in the columns of the Press.

From the fact of its continued use at Pike's Peak, we are inclined to think well of it. The *philosophy* of its operation is evidently sound. A most important condition attending its use is, what appears to be a act, that it reduces the quartz to an impalpable powder, at one operation. A further important consideration is that it works the ore *dry*. The latter we consider of great importance, as we believe it is now pretty generally admitted that a very large percentage of the precious metals, especially in gold crushing, is invariably carried off with the water, in spite of the most carefully managed settling vats. We shall cheerfully communicate to the public any *facts* with regard to the actual results of this machine, which may reach us through any reliable channel.

**LITHOGRAPHER.**—Mining Companies, and others, in want of any kind of Lithograph Work, will do well to call upon R. W. FISHBOURNE, at 529 Clay St. Some of the finest and best designed Certificates of Mining Stock we have ever seen are from his place. See his advertisement.

THE MARY L. GARDINER.—We have received many enquiries with regard to the "Mary L. Gardiner" Company, of Esmeralda. We know nothing more of it than we find in our Esmeralda Letters. We presume our correspondent writes from knowledge obtained upon the ground, although in the absence of any other advices, holders, in this city, do not credit the reported "strike."

SKEDADDLE.—This word is said to be pure Irish. The Irish *sgedad* means scattered; *sgedad ol* means all scattered. An old version of the Irish New Testament contains this passage: "For it is written, I will smite the shepherd and the sheep of the flock shall be *sgedad-ol*." The word was probably first used in our army by an Irishman, and, being looked upon as particularly felicitous, was at once adopted.

PHYSIOLOGY.—Old Dr. Pearson, of London, in lecturing upon the stomach, observed that this organ had no power over substances endued with vitality, and that this circumstance accounted for the fact of the Prophet Jonah having remained undigested in the stomach of the whale for three days and three nights! This is a step further than theology ever went.

**MEDICAL PRESS.**—We have received the July number of the San Francisco Medical Press. It contains much that is original and interesting, from able writers.

## THE MINERS' LABORATORY.—NO. X.

## MORE ABOUT SULPHURETS.

MR. EDITOR:—The following account of some Norwegian processes, may be of interest to your readers, as a contribution to the method of working Sulphurets. I only regret that in one case I am unable to send you the results of comparative experiments.

The first method is due to M. Aas, of Thydal. Its economy is based on the production of what he terms spongy iron, for the purpose of reducing copper from the residues of furnacing. The ores contain but 2 to 3 per cent. of copper; the remainder is iron pyrites. The "burnt pyrites" are lixiviated to extract the sulphate of copper, and mixed with a small quantity of small coal and the reduction of the iron is effected with the hot gases from a furnace, of the kind used for generating combustible gases, and there known as "gas generators." The heat is below the melting point of iron, and, for such temperature, these gases are very economical. It is obvious that this spongy iron is much cheaper than cast iron, and is in a form most excellently adapted to the chemical process of extracting the copper by substitution in the vitriol. The difficulty of furnacing pyrites in the way indicated renders it doubtful how far this is practical for working copper; but I can speak to the facility with which iron may be manufactured in reverberatories from such sponge—I must defer the remainder of this communication till you have more room for

A POOR CHEMIST.

San Francisco, July 1st, 1863.

["A POOR CHEMIST" is always welcome to our columns, and will never be crowded for "room."]

## SPECIAL NOTICE.

Some weeks since we forwarded blank receipts to such of our subscribers as are in arrears for their subscriptions. Some have promptly answered by remittances of the amounts due; others have notified us of special contracts with our predecessor, or of full payments made to him and not credited on our books. Where payments have thus been made, we have, in every instance, allowed them. There are quite a number, however, who have returned no reply to the bills which have been sent out. We trust all such will respond immediately upon seeing this notice. If payments have been made, we wish to be notified of the fact, so that due credit can be given; and if there are any to whom the paper is now sent who do not wish to continue it or do not intend to pay their subscription, we hope they will notify us of the fact so that we may discontinue sending papers to them. We do not wish to crowd the paper upon any man. All the names upon our list have been placed there, as subscribers, upon what we have deemed good authority. If any party, not considering himself a subscriber and in arrears, has received a bill for subscription, he will confer a favor by notifying us immediately of the fact. Postmasters are also reminded of their duty to return a paper that is not called for, etc.

## OUR MINING DIRECTORY—SPECIAL NOTICE.

The large call upon us for space in our MINING DIRECTORY, compels us to decline to receive the names of all Companies who are not subscribers to the MINING AND SCIENTIFIC PRESS, either in their Corporate Capacity or by their Secretaries. We have removed the names of several Companies from our list, this week, for the above reason, and have been compelled to decline to receive the names of several others, for the same reason. We trust that our mining friends will fully agree with us in the opinion that no one is a proper person to act as Secretary of a Mining Company, who declines or neglects to take the only Mining paper in the State, and to pay for the same.

THE TEACHER.—The first number of this journal has just been issued. A journal of this kind seems to us, almost indispensable to the growth and prosperity of our schools.

THE PACIFIC MONTHLY.—This magazine has again made its appearance on our table. We congratulate the proprietors of this periodical upon the happy faculty which they possess, to please their readers.

## RYERSON'S SUBMARINE EXPLORER.

We have devoted considerable space in another portion of the paper to a brief review of the history and progress of submarine machines, and given a somewhat minute description of "Ryerson's Submarine Explorer," the latest improvement in this direction. The chief feature of this invention, and the principle upon which it is based is the fact discovered by Prof. Ryerson that during the passage of spray through air vitiated with carbonic acid, the air is not only restored to its normal condition and fitness for sustaining both combustion and respiration, but that there is actually an excess of oxygen in air after this treatment. Prof. Ryerson, to account for this valuable phenomenon, has made calculations based upon the analyses of the late Dr. Deck, which lead him to the conclusion that a decomposition of the carbonic acid is instantaneously effected at the same time. Prof. Ryerson has informed us that the same effect is produced with fresh as with salt water and this in connection with the subjoined analyses seems to preclude the possibility of any other supposition.

{Copy.]

ANALYTICAL LABORATORY AND  
OFFICE OF CONSULTING CHEMISTS,  
No. 18 Exchange Place, near Hanover st., N. Y. }

I have analyzed samples of air collected from Ryerson's Submarine Explorer, by myself, as in the margin, and certify it to contain as under.

After the air had been breathed for over an hour by three full grown men, at twenty feet under water, with a pressure of one and a half atmosphere (1½), and candles failing and respiration laborious, 100 cubic inches measure contained:

Oxygen.....	20.65
Nitrogen .....	70.00
Watery vapor.....	1.10
Carbonic acid gas.....	8.25

Total.....100.00

Weight of 100 cubic inches at 60 deg., 33.060 grains.

There were traces of sulphur, ammonia and chlorine. The air was so impregnated with carbonic acid gas as to render lime water rapidly turbid.

When the fine pump spray had been playing from three to five minutes through the chambers, another sample was taken, and analysis showed 100 cubic inches measure.

Oxygen.....	22.00
Nitrogen .....	75.00
Watery vapor.....	2.85
Carbonic acid gas.....	0.15

Total.....100.00

Weight of 31 cubic inches at 60 deg., 31.025 grains.

There were traces of chlorine, (more than before,) no sulphur, no ammonia, no turbidity in lime water, and the breathing free and agreeable.

On my second descent in the Explorer, when I had every opportunity of observing its workings and took the accompanying samples for analysis, remaining over three hours without the slightest inconvenience, no air whatever was taken in the interior from the surface or from the compressed air chamber, and I have no hesitation in affirming that we could have remained twenty-four hours below, the air being purified and revived by the use of the spray pump.

ISAIAH DECK, M. D.,

Analytical and Consulting Chemist

The samples were obtained by Dr. Deck in the usual way, i. e. by taking bottles of water down in the apparatus and emptying them when it was desired to collect a portion of the air for the analysis. The result shows that after the application of the spray the air was purer than the ordinary atmosphere.

Again, under date of September 21, 1859, nearly a year subsequent to the date of the above, the Doctor gave the following as the result of a second analysis:—

"I have made an analytical examination of two or more samples of air, pure and impure, collected from Ryerson's submarine explorer, in the presence of six persons who descended in it and certify the results to be as follows:

After the air had been so far breathed by the above persons, without any connection or supply of air from the surface, so that the candles went out and breathing became oppressive, it contained in 100 parts:

Oxygen.....	16.00
Carbonic Acid.....	8.00
Nitrogen and Aqueous Vapor.....	76.00

Total.....100.00

When the spray-pump had been played for about ten minutes, and the candles and breathing freshened, it contained in 100 parts:

Oxygen.....	26.00
Carbonic Acid.....	1.50
Nitrogen and Aqueous Vapor.....	72.50

Total.....100.00

By these results the efficacy of the spray-pump in reviving the impure air, and doing all that is claimed for it, is undoubted—the revived air containing 10 per cent. more oxygen than the impure, and 5 per cent. more than the ordinary atmosphere.

ISAIAH DECK, M. D."

It will readily be perceived that the principle upon which this Submarine Explorer is founded, admits of its application in various ways. By varying its form, we have a complete SUBMARINE BOAT, capable of sustaining itself at any desirable point beneath the surface, without any connection with the upper air, and with unrestricted powers of locomotion, as capable of being directed by compass in its submarine navigation, as any floating craft would be in a dark night, on an enemy's coast, where the lights were extinguished. In this form, it may be rendered a most powerful submarine protection for harbors.

Again, as a diving bell, it must certainly, prove a most admirable piece of machinery for *Pearl Fishing*, as, by its assistance, the diver may go down to the bottom of the sea, and, where it is smooth work with as much facility as he could in a mere babbling brook. He can remain down the entire day, if he chooses, open his shells at his leisure, and make choice upon the spot, of those only which are valuable. Three men by the use of this apparatus could do as much work as a hundred by any other appliances hitherto devised.

This principle of purifying vitiated air, it will furthermore be seen, is eminently applicable to the ventilation of mines. But our remarks have already extended to a greater length than we had intended, and we close, with the intention of making further allusion to it in our next issue. The principle involved in this invention is one of the most interesting discoveries of the age, and, we think, our scientific readers will duly appreciate the space we have allotted to it.

INCIDENT.—The San Andreas Register relates the following incident connected with the Keystone Copper Mine, which shows how dame fortune often rewards those who persistently seek her favors. Mr. and Mrs. McCarty each owned an interest in the claim, and Mr. McCarty sold his interest some time since for \$10,000, and endeavored to persuade his wife to sell hers, which she refused to do. To-day she can take \$100,000 for the same interest.

## THE MINING SHARE MARKET.

The unusual excitement in the Mining share Market, noticed in our last issue, has materially subsided, and most of the leading stocks, which so suddenly advanced, have declined. The Market for the past six days has been somewhat fluctuating, and the transactions quite limited compared with the extraordinary business of the week previous.

Gould & Curry has declined to \$5,600, with a limited demand.

Ophir shares have been in considerable demand at about previous rates. 144 shares have changed hands the past week at \$2,500.

Central has been enquired for at \$2,850; sellers to the extent of 12 shares have been found at that figure. The sudden enquiry for this stock has been in consequence of advices from the mine that ore of superior quality has been struck, with indications of continuance.

California, adjoining the Central, has been effected to some extent by the favorable reports from the latter mine, and has also been called for at \$15.00. Twelve shares have changed hands at that figure. The stock in both these companies is confined to a few hands and held firmly.

The fact of a known location on the Comstock lead, with undisputed titles, renders the holders of stock in these two Companies, perfectly content to wait the gradual development of their mines; hence their stock is seldom effected.

Daney shares have fluctuated greatly, ranging from \$240 @ \$330, closing the week at about \$300. Seven hundred and forty shares have found buyers during the week at the figures named. The July dividends which were sold for \$13 @ \$14 ten days since, dropped to \$4 @ \$8 on Tuesday last, at which rates the dividends on 750 feet were sold. (See Report of Transactions.)

## THE COPPER INTEREST.

We continue to hear encouraging reports of the copper interest, from every direction where any attention has been paid to searching after that mineral. Stocks in all the leading mines are constantly advancing, and the attention of capitalists is being quite generally directed to this class of mines as extremely valuable property for permanent investments. Of the many discoveries which have been announced, it is hardly to be expected that anything like a majority will prove productive; yet sufficient developments have already been made to satisfy capitalists and the public that we may reasonably look to the copper interest as one of high promise, and one which, at an early day, must occupy an important position among the industrial resources of the State.

## REMARKS.

There has been considerable activity in the Virginia Stock Market since our last quotations, and the general attitude of the Market has been firm, with advancing rates in leading stocks.

Some promising developments have been made in both the Virginia and Gold Hill Districts; among which are reported the York, Insurance, Pride of Washoe, La Fayette, etc. These discoveries have generally been made upon what are denominated the "back ranges."

Grass Valley is still in demand and is quoted at \$70 @ \$75. A new claim, of small extent, called the Ruby, located near the Moscow ledge, has come into notice, and is quoted at about \$125.

Many important changes have occurred since our last quotations, especially in Gold Hill Stocks. Yellow Jacket has been quite extensively dealt in at considerably advanced figures. Leon has also been in much request, but at reduced rates.

steamships for New York.

For Freight or passage, apply to

**A. B. FORBES, Agent.**

je4 Corner of Sacramento and Leidesdorff sts.

## WHEELER'S

**Amalgamating and Separating Pans.**It is acknowledged by all who have examined the prin-  
ciples and witnessed the operation of these Pans, that  
they are decidedly superior for triturating and amalga-  
mating purposes to any other in use.The most important principle connected with the op-  
eration of these Pans is the separation of the triturating  
process from that of extracting the amalgam from the  
sand. The chief cause of loss of the precious metals aris-  
es from the passing off of the same in combination with  
the quicksilver, during the process of triturating, and in  
cleaning up. By the introduction of the Separating Pan  
to follow the triturating this loss is entirely avoided. In  
working these machines there is no appreciable loss of  
quicksilver, and hence none of the precious metals.Where these Pans have been introduced and operated  
by the side of others on exactly the same vat, the  
Wheeler Pans have uniformly gained a large percentage  
of metals over its competitors, as well as a still larger  
percentage in the amount of work performed.These Pans can be seen in daily operation, at the  
Miner's Foundry, on First street in this city, where all  
interested are invited to call and examine for themselves.  
je16-1f ZENAS WHEELER.**A. ROMAN & Co.,**

## MINING &amp; SCIENTIFIC PRESS.

**THE ONLY MINING, MECHANICAL AND  
SCIENTIFIC PAPER ON THIS  
CONTINENT.****THIRD YEAR! VOLUME VI.—NEW SERIES!**A new volume of this extensively circulated paper  
commenced Sept. 11, 1862. It is intended that every  
number shall be replete with information concerning  
Mining, Scientific, Mechanical and Industrial pursuits,  
together with several original engravings, of new inven-  
tions, etc., prepared expressly for its columns.This paper is devoted to the above purposes, together  
with the interests of Science, Arts, Agriculture and Com-  
merce, and any general information that may be of in-  
terest to the reader; and it is the intention of the pro-  
prietor to spare no pains or expense in making it equal  
in interest and valuable information to any paper yet  
published.**The Mining Interest!**Will find it of great value, as it will contain all the  
news appertaining to Mining, the prices and sales of Mi-  
ning Stocks, new inventions of Machinery adapted to that  
purpose, and of everything generally that may be of ser-  
vice to the Miner.**The Inventor!**Will find it an excellent medium for the purpose of  
bringing his invention into notice, of ascertaining the  
progress of invention in this and other countries, and  
also of receiving any information that may be neces-  
sary in obtaining his patent, the proprietors having had  
great experience as Patent Agents, together with facili-  
ties at Washington that enable them to obtain Patents  
with dispatch.**The Mechanic and Manufacturer!**Will be greatly benefited by its perusal, as its col-  
umns will from time to time contain original engrav-  
ings of new machines and inventions, together with a  
large amount of reading matter appertaining thereto.  
We are constantly receiving the best scientific jour-  
nals from all quarters, from which we shall continue  
to extract whatever may be of benefit or interest to  
our readers.**To Chemists, Architects and Millwrights.**This journal will be invaluable. All new discoveries  
in Chemistry will be given, and a large amount of infor-  
mation of great service to Architects and Millwrights  
will be found in our columns. The Farmers and Plan-  
ters will not be neglected, engravings will be given of  
agricultural implements, and the farming interest gen-  
erally will be amply discussed.

**F. E. WEYGANT, PROPRIETOR**

**Tremont House,**  
418 and 420 ----- Jackson Street,  
[A few doors from Montgomery.] SAN FRANCISCO, CAL.

THIS FINE, FIRE PROOF BUILDING OFFERS MANY advantages to the traveler for convenience. It is only half a block from the Post Office and Custom House, and about the same distance from the principal places of Amusement

The City Railroad Cars pass the Door.  
The House is conducted on Temperance Principles,  
WHICH SECURES TO OUR GUESTS QUIET.  
The prices for board and Rooms are very moderate by the day, meal or week. We solicit A CALL FROM ALL.  
**F. E. WEYGANT, PROPRIETOR.**

For the accommodation of my many guests I have taken and refurbished the INTERNATIONAL HOTEL, and will carry on the two houses in connection, so that Travelers wishing to put up at either house, may take the Tremont or International Hotel Coach and be taken to either House with their baggage, FREE.  
**F. E. WEYGANT.**

**Volcanic Smelting Furnace.**  
PERSONS DESIRING INFORMATION AS TO THE USE and economical properties of this Furnace, and intending to make use of the same, when satisfied of its superiority over all other means of reducing ores and separating metals from the sulphurets, can obtain all needed explanation and advice in regard to the same, and the terms of sale of rights to use the same, on application Col. J. D. Stevenson or T. Ogg Shaw, or by letter to the proprietors through the Post Office of San Francisco. Drawings may be seen at the office of Col. J. D. Stevenson, No. 614 Merchant street, or at the office of T. Ogg Shaw, in Braden's Building, Montgomery street.

The time required for reducing ores by this Furnace is from three to eight hours, and the amount of fuel only one-tenth as much as is consumed by other processes.  
The process of condensation is applied to this Furnace which will save all those portions of precious metals which usually escape in a volatile form.  
The attention of all interested in the subject is requested to examine the important results obtained by this process.

Parties wishing will be allowed to erect a trial Furnace of capacity for smelting one ton of ore or more, on signing no obligation to pay the usual fee for the right to use it, should they continue to make use of the invention or a longer period than two months.  
mch 16 MRS. E. J. HALL, M.D., Proprietress.

**50 lbs. MARINE and Fire-Proof Paint,**  
MANUFACTURED BY THE PACIFIC METALLURGICAL Works in this city, for Hulls and Decks of Vessels, from ground Mineral Rock contains Arsenic, Copper, Litharge and six other Minerals. When used on the Decks or Bottoms of Ships, it is equal to a coat of Stone, and quite equal to Copper, no worms will ever effect it, and cheaper than any other paint.

**DIRECTIONS:**  
For Decks of Ships, use two parts Mineral Paint, one part White Lead, mix with Linseed Oil.  
For Bottoms of Vessels, use one part ground sulphur three parts Mineral Paint, mix with Coal Tar and apply it hot.  
For sale by all Ship Chandlers and Tradesmen, in boxes of 50 lbs. each, or by the Pacific Metallurgical Works.

**25 POUNDS FIRE-PROOF PAINT.**  
When used on Roofs, Buildings, or Fences, it is equal to covering them with a coat of Stone, being perfectly Fire Proof, and costing less than any paint.

**DIRECTIONS:**  
HOUSE:—Mix three parts Mineral Paint with one part white lead, thin with Linseed oil: if a lighter color is wanted, mix less paint, more lead.  
ROOF:—Five parts of Mineral Paint, one part white Lead; mix with Linseed oil. Put it thick on a tin Roof as one coat when properly applied will last three years.

## THE BRYAN BATTERY.

The vast interest involved in the reduction of ores on this coast, renders it of the highest importance that the Machinery employed for this purpose should be of the most Effective, Economical and Durable Character. It may be safely said that Millions of Dollars have already been spent upon the various experiments in this class of Machinery, and it is a fact well known to all who have had any practical experience in the matter, that every new process developed during the past twelve years, has been set down as a failure. The Ordinary Stamp Battery

### ALONE STANDING THE TEST.

This, with the Improvements which Experience has suggested, is now regarded, by common consent, as the only reliable

### METHOD OF CRUSHING ORE.

The BRYAN BATTERY, as now constructed, is believed to combine all the improvements which the experience of the past has afforded. They have been

### EXCLUSIVELY ADOPTED

by many of the most prominent Mining Companies in the country, and have been, for the three past years, subjected to the severest of all test—that of constant use—and in every case has been pronounced

### EFFECTIVE, SUBSTANTIAL AND RELIABLE.

They are now extensively used throughout the mineral regions of California, Nevada and Mexico, and have established a claim to public confidence, never yet equalled in any piece of machinery.

These Mills are constructed almost entirely of Iron, and, consequently, are not affected by the intense heat and dryness of atmosphere, common to all mining localities. They are adapted to

### BOTH WET AND DRY CRUSHING,

and are warranted to reduce, with the same weight of Stamps, 25 per cent, more rock than any other mill in use. Each Battery is complete in itself, and forms a perfect mill—while any number of them can be added at a subsequent time—thus preserving the symmetry and uniformity of the Mill

As an evidence of the increasing favor with which these mills are regarded, we would mention that the Celebrated Ophir Company first introduced them into their works in 1860, and have been adding a number of Batteries, each subsequent year, until they now have Nineteen, running Seventy-six Stamps.

They are perfectly fitted and set up at our Works, before shipping, each piece being marked and numbered, so that they can be put up and set at work in ten hours after arriving on the ground. They are made of two sizes with four and five Stamps, etc. The Four Stamp Battery weighs, when complete, about 6,000 pounds, and the Five Stamp about 7,000. The Mortar Bed, when desired, is cast in sections, so that the mills can be packed over any mountain road.

We annex the names of a few well known Companies who have adopted them—running from four to seventy-five stamps each—to whom reference is made:

Ophir Mining Co., Washoe Valley,  
San Marcial Co., Mexico,  
John D. Winters & Co., Esmeralda,  
Crown Point Co., Gold Hill,  
Potosi Mining Co., Virginia City,

New Patent Agency.

WE HAVE CONNECTED WITH THE Publication of the "Mining and Scientific Press"

The Patent Agency Business,

And would invite Inventors and Discoverers on the Pacific coast, who wish Dispatch as well as Economy to call upon us. We have an Experienced Agent at Washington, which, together with our own experience of several years, renders the

Mining and Scientific Press Agency

The most desirable place to make application for Letters Patent on the Pacific coast. Apply at Office of the "Mining and Scientific Press," Room No. 27, Federal Building, corner of Battery and Washington streets, (directly opposite the Post Office,) San Francisco. EWER & SMITH.

FOREIGN PATENTS OBTAINED

By application at this office, Room 27, Federal Building. EWER & SMITH, Solicitors.

NOTICE TO INVENTORS.

Inventors wishing to file Caveats should apply at this Office, Room No. 27, Federal Building. Terms moderate. EWER & SMITH.

PATENT RIGHTS.

Patent Rights Bought and Sold, At the office of the "Mining and Scientific Press" Agency. EWER & SMITH.

IMPORTANT TO INVENTORS.

Inventors who obtain their Patents through this Office can have their Inventions illustrated and described in the columns of this paper. Free of charge, they merely furnish the engravings. We are also prepared to furnish engravings at reasonable rates. Those who do not care to go to the expense of having engravings prepared can have their inventions fully noticed and described in our columns, free of charge. The free use of our columns to aid them in introducing their inventions to the public will be found a most important advantage to inventors. EWER & SMITH.

To Mining Companies.

FOR SALE—A STEAM ENGINE AND BOILER. The Engine is 30 horse power—10 inch cylinder—24 inch stroke—solid iron frame, with heater, pumps, etc., all complete. The boiler has 5 flues, is 24 feet long, 40 inches in diameter, made up from the best three-eighths inch Low Moor Iron, and weighs about 5000 pounds. Both Engine and Boiler are in perfect order and fully guaranteed. Apply to I. H. HAM, No. 211 Clay st. San Francisco, June 13, 1863. 3t

Office of the Nevada Copper Mining Co. March 24, 1863.—At a meeting of the Board of Trustees, held this day, an assessment of Forty cents per share was levied upon the Capital Stock of the Company, payable twenty (20) cents per share within thirty days, and twenty (20) cents per share within sixty days from this date, to the Secretary. By order of the Trustees, J. ARMSTRONG, Secretary.

EWER & SMITH,  
PROPRIETORS.

VOL. VI.

SAN FRANCISCO, MONDAY EVENING, JULY 13, 1863.

NO. 37.

Every person at all acquainted with the process of amalgamating Ores, knows that it is necessary to reduce the ore to the finest possible condition in order to obtain all the metal contained in it, and the quicker the ore is reduced to such a condition, the more rapid will be the process. To meet this necessity has been the object of the invention we illustrate to-day.

Most of the Amalgamators now in use, are constructed with mullers of some sort designed to reduce the ore while the amalgamation is going on, but the time required varies according to the speed at which the mullers can be run without producing too much agitation of the pulp. Some mullers do not make more than twelve to fifteen revolutions per minute, and from six to eight hours are required to reduce 200 pounds of ore to the requisite fineness, whilst other mullers run much faster and consequently do the work much quicker.

THE LITTLE GIANT AMALGAMATOR, promises to do the work in much less time than any other Amalgamator in use, when run at the same speed, as it has a double grinding surface. We copy the following description from the proprietor's circular:

Fig. 1 is a perspective view of the LITTLE GIANT AMALGAMATOR, with a portion of the top of the pan removed so as to show the position of the mullers when in their proper position for working. The mullers A B C are constructed in the following manner:

A is the bottom die furrowed or guttered, as represented by Fig. 3, and lies in the bottom of the pan, and is stationary when the runner is in motion. B is the runner, also furrowed or guttered on the bottom side, as shown by Fig. 3, except that the furrows cross each other so as to work shearing, like an ordinary mill-stone, when grinding.

This runner rests on the bottom die. The upper side of the runner is guttered or furrowed, as represented in Fig. 2. The top of the plate, A, is furrowed or guttered on the bottom side, the same as the top side of the runner is guttered or furrowed; and when placed on the runner, the gutters are reversed or made shearing, thus making a grinding surface. The top plate is stationary, but so arranged that it can be made to revolve upon the runner by means of the screws, E, E, E.

The top plate has slots or openings communicating with the gutters or furrows, so that the pulp is continually running through them when working. The pan is capable of amalgamating from 800 to 1000 lbs. at a time, from the fact that the top plate is stationary, the muller can be run at almost any speed desired without giving too much agitation to the pulp. The construction of the mill and runner is such that the pulp is driven from the center to the side of the pan in the bottom gutters, and from the side to the center of the pan through the top gutters,

## Coleman's Little Giant Amalgamator.

FIG. 1.

FIG. 2.

FIG. 3.

thus creating a constant motion back and forth through the gutters, and causing all portions of the pulp to pass between the grinders, and is thoroughly ground to an impalpable powder in about half the time of any other grinder in use. A most important point in connection with these grinders, is, that they are adapted to any pan in use, and those having other pans can have the mullers put into them at a small expense by forwarding size of pan and hub; also, the depth of the pan.

This pan may be seen in operation near

the Miners' Foundry, in this city, where all interested are invited to call and see for themselves.

Since the above illustrations were prepared the inventor of this Amalgamator has added a new and important improvement, which it is believed will add largely to its efficiency as an amalgamator. This improvement consists in casting the mullers with wrought iron strips in them, placed lengthwise between and parallel to the slots and

furrows of the dies and plates. When the amalgamator is working the wrought iron strips cast into the muller run against the similar strips cast in the stationary dies, thereby producing the same effect on the pulp as is produced in the "barrels" when working after the Frieberg Process.

MR. EDITOR:—Your announcement of Prof. Ryerson's valuable discovery in purifying the air in Diving Bells, suggests some further inquiry as to the liberation of the oxygen in the circumstances mentioned. Will some of your readers favor the public by discussing the probability of the newly observed action of spray, being due to what is known as the action of contact with finely divided substances, such as the combinations of nitrogen, effected by platinum-black—of hydrogen and oxygen by the same—of sulphurous acid and oxygen by oxides of chrome and copper? Is it not that the increased surfaces of the numerous drops of water absorb and condense gases such as carbonic acid, and modify the chemical affinity of their elements?

A POOR CHEMIST.

San Francisco, Ju'y 10, 1863.

PROGRESSIVE.—The Vulcan Foundry have found their Office too straight and narrow for them and have removed it to the rear, on First Street, and are now erecting a new and commodious Office upon the site of the old building.

SOUTH PARK QUARTZ MILL.—As will be seen by Messrs. Smith & Co's Advertisement, we have a veritable Quartz Mill in San Francisco. An examination of the Mill enables us to pronounce it also a very complete one. A moment's reflection will show its advantages at the present time. Persons coming to this city with ore of any description, can have it crushed at Messrs. Smith & Co's, under their own supervision, and learn to a fraction the value of their rock.

LUBRICATING OIL.—Many substitutes have been proposed for the more costly oil for lubricating machinery but hitherto with only partial success. An English patent consists mainly in the addition of caoutchouc to common grease the former being softened by spirit of turpentine; but it also contains other ingredients. For example: 10 gallons of water being heated, 1 pound glue and 10 pounds carbonate of soda are stirred in, 10 gallons of oil or grease are next added whereby a quasi soap is formed, and lastly 4 pounds caoutchouc, softened by turpentine, are incorporated.

The French process is as follows: Add one pint finely minced caoutchouc to 60 pints rape oil, and heat until the mixture is complete.—A very unctuous oil is thus formed, which remains fluid at freezing temperature, and does not clog the machines, but facilitates the motion of their parts.

## MINING CORRESPONDENCE.

NOTES OF A TRIP TO SLATE RANGE via LOS ANGELES AND EL PASO.—No. 5.

MESQUIT SPRINGS, JUNE 8TH, 1863.

MESSRS. EWER & SMITH:—Your favor of May 13, came to hand on the 5th, and I have to-day received some paper which enables me to go on with my correspondence, also, Nos. 26, 27 and 28 of the MINING AND SCIENTIFIC PRESS, for which I am much obliged. I believe that I can get some subscribers here for that work, as soon as a little currency begins to circulate. At present no one seems to be made of coin in any way. All who come here to prospect are well supplied with provisions, and tools, and those who have been out long enough to require supplies, notify their resident partners, in Los Angeles or San Francisco, and the goods are forwarded, and the bills of purchase and freight are all paid at Los Angeles or Frisco.

## SCARCITY OF CHANGE—SACKETT'S EXPRESS.

We would spend some change for paper, postage stamps, envelopes, &c., if there were any here for sale. There are none except the few each may have in his pocket, and we have to order a supply from Los Angeles, our nearest post-office and 147 miles South, requiring 30 to 60 days to get returns.

Your favors came by Sackett's Slate Range Express, advertised to leave Los Angeles promptly on the arrival of the Senator from San Francisco, taking freight and passengers, fare \$10 and walk all the way, and ten cts a pound for freight blankets, provisions, &c. On the 10th of April he arrived in Los Angeles from Slate Range, and now on the 5th of June, he is within two days of Slate Range, on his back trip. When horse Express teams get over the road in such style what can be expected from ox teams which are more popular on this route than horses.

## LAUREL HILL AND THE MINES GENERALLY.

About the middle of last month there was a general stampede of miners from all the camps to Laurel Hill about 15 miles North and the end of the El Paso range in that direction, leaving me to take care of the goods and chattels of three camps here. All still remain there and I am confined at the Springs and cannot leave to prospect or examine the claims which are taken up in this vicinity. Neither can I get any information from any one in regard to the first discovery of this District and its general history. I expect some of them back in a few days, to develop some leads which show very rich croppings.

There will be a number of tons of rock from various leads ready for shipment next week, and teams are expected to call for it, on their return from Owens River, Coso, &c., &c. I shall certainly be able to procure you some specimens next week and send them forward.

When we have returns from these lots soon to go forward we shall know more what to say of the District; at present we are quite in the dark, though our hope is large, and nearly every man has had experience in Slate Range, and considers this to be quite superior in some respects to that locality, and again a lead which will assay here one half as high as one in Slate Range would be equally as available, as there is water in plenty here, and wood can be delivered at less than half what it can there, and freight from Los Angeles can be landed here at half what it can at Slate Range.

## MILLS AND MILL PRIVILEGES, ETC.

We are about 45 miles southwest from Tehachapa Valley, where Messrs. Bright and Lyons have a saw mill in successful operation on a living stream of water, and they are preparing to erect a quartz mill of five stamps to run half the time. Again at Oak Creek 45 miles southeast, there is plenty of water power for a dozen mills, and we shall soon have a chance to crush and reduce our rock, if we find it as good as it looks.

Gentlemen, as soon as you find our croppings to be worth working, say at an expense of 75 dollars per ton, you might offer that machinery you advertise on your last page, to some parties having good claims here, and thus receive a permanent interest. [We are anxiously watching for those "croppings."—Publishers PRESS.]

Some of our best leads are now offered as follows: The owners will deed one claim of 1200 to 1800 feet to any party who will sink a shaft on the same sufficient to confirm its value, say 30 to 50 feet, or tunnel to same depth, and

Messrs. Banning, Keller, and Moore of Los Angeles are now opening 10 to 20 leads on those terms, and will soon ship the rock to Frisco to determine its value.

It seems to me that large quantities of rock can be got out here now, from croppings, which will pay a profit to ship, though the charges are about \$100 per ton.

C. W. T.

Silver Mountain, East Fork of Carson, }  
Amador Co., June 24, 1863. }

FRIEND SCIENTIFIC PRESS:—Believing that many of your readers will be interested (I know that some of them will) in matters pertaining to this region, I give you the following facts and speculations with regard to what must unquestionably prove, ere long, one of the best of all the new locations of the Eastern Slope.

Silver Mountain District is situated on Silver Creek, a tributary of the East Fork of the Carson River, some 2½ to three miles above the junction. Silver Creek has at the present time a volume of something like a thousand "streams," (12 inches to a stream) and I am told that it will be little if any less during the season: probably it is never smaller than one half that amount, and has such fall that I think a mill privilege can be located to average one in every 500 yards of its length. It flows a little on one side of the beautiful valley in which is situated the present town of The "Mountain," or as its earlier settlers call it, "Koningsburg."

The town contains some 300 inhabitants, is well supplied with stores; illy supplied with whisky shops (though there are many of them); has a 1st class frontier hotel, a good restaurant, besides several boarding places where a hungry man can get his regular hash, a bakery, livery stable, blacksmiths, shoemakers, one sawmill, another going up, and

## SOME OF THE MOST PROMISING MINES EVER FOUND.

The Mountain No. 1, just incorporated, is undoubtedly the Comstock Lode of this District, if indeed it is not, as some assert, a continuation of that great Mother vein itself. An old mountaineer and prospector tells us that he has traced it through the whole sixty miles that intersect between this point and Virginia City. Certainly, from specimens of rock in my possession, it can be seen that an intimate relationship exists between this and the original Gould & Curry, and a number of connoisseurs have also remarked this to me.

Mountain No. 1, is a claim of 2750 feet in length, well defined throughout its whole surface length, with at times, splendid outcroppings. It was discovered by a party of Scandinavians, by whom a tunnel was run in some 260 feet, which tunnel has struck the lode, here about 12 feet wide. Any quantity of rock can be obtained with small expense, which it is supposed will pay well for crushing.

The expense of transporting to a mill will be absolutely nothing as the ore can be thrown into a "shute" extending from the dump pile down some hundreds of feet to a magnificent mill privilege. Several well known capitalists are trying for this claim and a controlling interest must undoubtedly ere long change hands, as it can be obtained at very reasonable figures, its principal owners knowing well its great value, but willing to sacrifice something to expedite the erection of a fine mill.

Northward of the "Mountain" Co. are the Mammoth, Silver Prize, and St. Charles, on all of which work has been or is being done. Southward, the 1st Extension is the Jefferson Co., who have run a 30 feet tunnel and have up a notice of another contract to let. Above the Mountain some hundreds of feet is the "Big Tree Company." They have a splendid outcrop, and have let a contract for 50 feet of tunnel which will probably strike their ledge, which they will get into about the middle of August at farthest, judging from the energy of the Contractors.

And here let me digress for a moment from leads to speak of the needs of the District and the chances for laboring men. There is an abundance of work for 1000 men in Silver Mountain alone. During 24 hours of my sojourn here, over eleven thousand dollars (so I am informed) has been pledged to build the road in from Hermit Valley to this great point. This will require the labor of some seventy-five or one hundred men for sixty days time. Nearly or quite that number are now employed on that part of the route between Hermit Valley and Big Meadows, (31 miles this

side Murphys) and when the road is complete from Murphy's to Silver Mountain, (only 56 miles) there will be money subscribed very soon to carry it to the East Carson, down through the Monitor, Alpine and Mogul District to Washoe, by all odds the nearest, best and pleasantest route, passing through as it does some of the most picturesque and grandly sublime mountain scenery on the globe. There are in this District probably 80 tunnels being run or shafts sunk. Laboring men get by the day \$4, but the most of the work is being done under contract, at from \$12½ to \$30 per foot, at which good drifters commonly make much more than day wages, even to as high as \$20 per day to the man. More tunnels would be commenced, more work would be done, if there were more workers to do it, and what better field presents itself to laboring men, considering in connection with the chance for gain, the absolute healthfulness of the location and the certainty of his getting his pay?

Next to the great need of labor is the need of roads, but this in some measure depends on the former, and the parties now in charge of the undertaking, will unquestionably find means to get their highway open early in September, so that, instead of as now, long lines of laboring pack-mules, the long line of mule teams will with their jingle of bells make "Babel" in the streets of Koningsburg. More anon  
P.

## SPECIAL NOTICE.

Some weeks since we forwarded blank receipts to such of our subscribers as are in arrears for their subscriptions. Some have promptly answered by remittances of the amounts due others have notified us of special contracts with our predecessor, or of full payments made to him and not credited on our books. Where payments have thus been made, we have in every instance, allowed them. There are quite a number, however, who have returned no reply to the bills which have been sent out. We trust all such will respond immediately upon seeing this notice. If payments have been made, we wish to be notified of the fact, so that due credit can be given; and if there are any to whom the paper is now sent who do not wish to continue it or do not intend to pay their subscription, we hope they will notify us of the fact so that we may discontinue sending papers to them. We do not wish to crowd the paper upon any man. All the names upon our list have been placed there, as subscribers, upon what we have deemed good authority. If any party, not considering himself a subscriber and in arrears, has received a bill for subscription, he will confer a favor by notifying us immediately of the fact. Postmasters are also reminded of their duty to return a paper that is not called for, etc.

NOTICE.—In our advertising columns, will be found the card of BRODIE & Co., California Foundry, Fremont St near Market. In their particular line of business, making plain and ornamental castings, for stores, private-house and public works, they exhibit workmanship creditable to themselves and the city.

WE would call attention to the Card of D. MORRIS in our Advertising columns to-day. Those wanting Fire proof Safes made or repaired, will not find a better workman in town, than Mr. Morris, 227 Market Street, corner Beale.

EXCELSIOR IRON WORKS.—The Card of Gallagher Kenney, Manufacturers of Architectural and Ornament Iron Works, will be found among our new Advertisement to-day. These gentlemen are prepared to execute every kind of work in their line, with dispatch, and in a style to be excelled by any other Manufacturers.

We would call attention to the Card of H. C. KIEBE, Esq Mining Secretary and Commissioner for Nevada Territory which will be found in our advertising columns to-day. A business entrusted to his care will be promptly attended

KAMPTULICAN.—Lieut. G. Walton, of the British Navy has proposed a mixture of sawdust and caoutchouc under the name of kamptulican, as a lining for iron war vessels. The inventor claims that from its elasticity, it will immediately collapse when penetrated by a ball, and thus prevent the entrance of water. It also deadens concussion, and its buoyancy will keep a vessel afloat though it should be riddled with shot, and moreover will prevent loss of life caused by splinters. [The Cornplanter and Mechanic.

## COPPER MINING.

The Mining Era of that section, throwing out of view the ancient workings, of which we know but little, commenced about the year 1844. The wonderful reports brought from there, and based too upon the explorations of men of undoubted veracity and well known scientific attainments, produced a fever of excitement which resulted in the rush thither of large numbers of adventurers and capitalists; and Companies were formed by hundreds, to work the various localities, all of which, it was thought, *when they got deep enough* would ensure fortunes to the adventurers. A period of some three years was occupied in thus locating and prospecting. We have no means of knowing how many Companies were organized; but they were numbered by scores, not by hundreds. At last, however, the inevitable crisis came, and at the close of 1847 only *six* Companies, out of the entire number, were found actually engaged in mining. Of course, a great distrust in the entire locality was at first superinduced, which gradually, however, gave way before the convincing proofs adduced by the few genuine operations which survived the crash, that there was a value in judiciously located mines. The revulsion was finally beneficial in exposing the spurious and worthless schemes, and bringing into especial notice those of actual worth. Since that period the mining progress of that region has been steady and legitimate until, at the present time, it is producing not far from one seventh of the entire copper product of the world.

We fear, from present indications, that Copper mining, in this State may have to undergo a similar ordeal. We deem it a matter almost incredible that more than a mere tithe of the Companies now organized, and in immediate prospect can hope to become dividend paying institutions, ; and it may not be amiss to throw out a hint in season, that our people should be cautious in their investments in "copper feet," and not be too hasty to place high valuations upon undeveloped mines.

It should be born in mind that all past experience goes to show that but a small proportion of even quite promising surface indications are developed into permanent, dividend paying mines. Many, even, that will afford a good business to actual working proprietors, will never become valuable as dividend paying investments. There need be no fear, however, from developments already made, but that California will eventually abound in rich mines of copper, as well as of gold and silver; but all, cannot be rich. Although copper mining is more reliable than mining for gold, still our experience in the latter should warn us to beware lest we promise ourselves, too much from superficial indications. We would by no means seek to discourage the prospector; we simply suggest that he who buys feet for investment should beware of buying at fancy prices upon mere surface or shallow indications. A copper mine, producing shipping ore in fair quantities, is undoubtedly valuable property, but the number that will become such in this State, is much smaller we imagine, than most people, under the present excitement, are willing to admit.

THE Humboldt Register says: "With all the flood of immigration, workmen are wanted still. Companies are advertising for proposals to do work—for cash; but half the time no bids are put in. Notices are put up, inquiring for workmen to take foremanship of work on ledges, at good cash prices—\$4 to \$5 a day.

[illegible]

## COPPER—ITS PRODUCTION AND DEMAND.

Copper is one of the six metals spoken of in the Old Testament, and one of the most important of the seven which were known to the ancients. The earliest artificer known in history, Tubal Cain, according to the writer of Genesis, was a worker in "brass," which is an alloy of copper. This testimony of the Sacred Writ is somewhat conflicting with the text of the ancient Greek Historians, who attribute the discovery of copper to Cadmus, who lived contemporary with Joshua. Whether the discovery of copper should date from the days of Tubal Cain or Cadmus, there is certainly abundant testimony that it is at least one of the earliest known metals. Aside from its mention in the most ancient records, it is readily supposable from the nature and mode of its occurrence, that it must early have come into use for weapons of defence and utensils of industry. Occurring as it frequently does, massive and native, and often detached, by water, from its original matrix, it is most reasonable to suppose that it must have thus been found at an early day, in localities where warlike people resorted to seek stones with which to shape their instruments of war, or out of which to form those instruments. The peculiar lustre, weight, and malleability of this metal would naturally attract attention, and thus, it is more than probable, that copper was the first metal upon which were essayed the earliest attempts at primeval smithery. Perhaps we might, with a high degree of probability, divide the honors with the ante and the post-diluvian celebrities, by according to Tubal, or his ancestors, the discovery of the native metal, while his post-diluvian rival in the honors of discovery might have taught mankind how to obtain metal from its ores.

Copper, either of itself or in its alloy with tin and zinc, for a long period of time, doubtless, constituted the chief metal employed in the arts, agriculture and war. It must have entered largely into commerce at an early day. The Colossus of Rhodes, which was constructed of an alloy of this metal, affords a most convincing proof of its great abundance at that time. It is stated that the canal which was dug across the Isthmus of Suez, by the Ancient Egyptians, the remains of which have been unearthed, in places, by the present effort, in that direction, by Louis Napoleon, was constructed chiefly for the purpose of connecting the copper producing countries of Arabia with the region of the Nile—another evidence of the great abundance of this metal at an early day.

The remains of ancient copper mines are to be seen, at this day, among the Ural Mountains, which were worked by copper tools, as is known from their remains, and of course at a period anterior to the introduction of iron for the manufacture of tools.

It is only, however, since 1830 that copper has been produced in anything like its present abundance. In that year the total amount of copper produced throughout the world was but 25,500 tons; in 1840 the amount produced was 41,000—nearly doubling in ten years—in 1850, the production had reached 54,700 tons. The product of 1860 is estimated, by competent judges, at 70,000 tons. Yet, rapid as has been the increase within the last thirty years, the price of that metal has risen very notably.

When the world was startled by the first reports of the wonderful gold discoveries in California, the opinion seemed to be pretty generally entertained that, under such prodigious supplies of the precious metal, its value must depreciate. The same question again agitated the commercial world when the extent and magnitude of the remarkable silver discoveries of Washoe became fully known. Notwithstanding the fact that gold and silver still maintain their value and promise to do so to an indefinite future, we yet find a similar class of predictions in regard to the supposed consequences to result from the immense prospective increase of copper from the newly discovered mines of this State.

In examining this question briefly it may not be amiss to look a little into the past. As will be noticed from what we have already said, the history of copper mining has commenced a new and important era within the last twenty-five years. During that time its production has fully doubled, and yet we find the refined metal (though subject to considerable fluctuations) constantly increasing in price. By reference to English statistics we gather the following facts in reference to the amount of copper ore sold in England

		and the price of the refined metal, in the British Market:	
	tons of ore sold	\$586 price per ton	
1800	55,681	661	" "
1810	66,048	596	" "
1820	92,672	531	" "
1830	135,665	531	" "
1835	163,607	542	" "
1840	147,266	516	" "
1845	157,000	520	" "
1850	150,890	531	" "
1952	152,802	700	" "
1854	190,687	665	" "
1856	206,177	657	" "
1858	182,391	666	" "
1859	183,944		

From the above it will be perceived that notwithstanding the constantly increased production of copper in Great Britain the price of that metal has advanced fully fifteen per cent. since the commencement of the present century.

Again, let us refer to statistics of our own country. The yield of the copper mines of the United States and Canada for the year 1840, was but 100 tons; we have no data for fixing the value of the metal other than by the ruling price in Great Britain, which was \$542 per ton. In 1850 the yield of our mines had increased to 650 tons, and the price of copper in New York was \$420. We subjoin a tabular statement, derived from the best authorities, of the value of copper in the New York Market from 1850 to the present time, together with the production of that metal in the United States for the years 1852, '53 '57, '61, and an estimate for the present year:

Year.	Market Value per Ton.	Tons Produced.
1850	\$420	650
1851	425	...
1852	425	...
1853	583	2,000
1854	546	...
1855	567	...
1856	535	...
1857	260	3,000
1858	463	...
1859	460	...
1860	441	...
1861	425	7,500
1862	567	...
1863	690	12,000

It will be observed, from the above, that the advance in the price of copper in the United States has fully kept pace with the advance in the English Market.

The annual consumption of copper in England, at this time, is about 30,000 tons, about one third of which is obtained from her own mines. Germany consumes about 20,000 and France about 15,000 tons of copper annually. The consumption of the United States for the present year is estimated at 15,000 tons, and that too, in face of a most unprecedented advance in price, while our production of that metal is estimated at only 12,000.

The recent discoveries in this State will doubtless exert considerable influence upon the copper market, when the mines come to be thoroughly opened. But the effect produced will not be of greater value than the fluctuations noted above, in both our own and the English Market. The constantly increasing demands of commerce, and the innumerable purposes in which copper may be employed as an alloy, provided but a small reduction only, in price is effected, will so increase the demand for this metal that our copper miners need feel no uneasiness least their stalwart arms or rich ore producing mines shall so glut the market of this metal, as to bring its price down to an unprofitable standard. Let our copper mines prove as rich and productive as the most sanguine may hope for, a mine producing shipping ore of a fair quality and in good quantity cannot fail to become a most valuable property, and as safe an investment as can be found in any branch of business.

✂ We are receiving letters almost every day from parties who say that they have "struck it rich," and by the aid of knowledge derived from articles in the MINING AND SCIENTIFIC PRESS, have been enabled to distinguish what was valuable. One correspondent writes that he was led to examine certain rock, by reading an article in the PRESS describing ore, and found it to be very rich ore. Had not his attention thus been especially directed to it, he would in all probability, have passed it over in utter ignorance of its value. Another says, "I was first led to notice copper rock by articles in your paper, called the 'Miners' Laboratory,'

and found it to be a rich lead, but, what is strange, I had previously walked over the spot a thousand times without suspecting it to be of any value."

It is a source of no small congratulation with us to learn from the miners themselves that we are making the paper valuable to them as a class. All the return we ask is that our mining readers will do what they can to aid us in giving the PRESS the largest amount of circulation possible throughout the mines, as well as in the great commercial cities of the State.

## A VERITABLE GOLD MINE IN SAN FRANCISCO.

For several years past it has, from time to time, been announced that gold bearing, and other metalliferous rock has been discovered in and near this city. That such rock has been found, as isolated specimens, or in very small quantities, is beyond a doubt. But we opine that it is only within a few days, or weeks at most, that gold bearing rock has been discovered in any considerable quantity. It appears now, however, a pretty well authenticated fact, that an immense mass of auriferous quartz, of a highly metamorphic character, has been protruded upward through the bed of slate upon which this section of country rests. How extensive this protrusion may be we cannot say; but at all events the high ridge, just back of the Mission Dolores, with the two rocky prominences nearest that location are capped, if not ribbed, with an immense mass of porphyritic quartz, in a highly metamorphosed condition, and presenting to the eye of the practiced miner, strong auriferous indications. We are assured furthermore, by parties in whom we have every reason to place confidence, that gold can be obtained, by ordinary pounding of the debris of the rock, to all appearance in workable quantities, over an extent of country from one to two miles in length, by from fifty to five hundred feet in breadth. Millions of tons of this rock crop out upon the surface, in some places presenting almost perpendicular masses, and scores of feet in extent and height. Some eight or ten Companies have already been organized, and active preparations are in progress for thoroughly testing the value of this discovery. One Company has had several lots of rock crushed in the city and subjected to the panning and amalgamating process at the Miners' Foundry, with results varying from \$25 @ \$70 per ton. We have seen one lot of amalgam, weighing six ounces, taken from 1000 lbs. of ore which was still undergoing a further process of treatment. This rock was taken from the surface, with even the moss clinging to it, and thousands of tons more of precisely similar rock is in plain view—in fact a perfect mountain of it! The owners of this claim purchase their title from a Spanish Grant, before the knowledge of the existence of the gold became known, paying therefor \$30,000. A large number of claims have been staked off.

OLD DR. BEECHER'S IDEA OF HEAVEN.—"Excepting exception from sin, intense, vigorous, untiring action is the greatest pleasure of mind. I could hardly wish to enter Heaven did I believe its inhabitants were idly to sit by purling streams, fanned by balmy airs. Heaven, to be a place of happiness, must be a place of activity. Has the far-reaching mind of Newton ceased its profound investigation? Has David hung up his harp as useless as the dusty arms in Westminster Abby? Has Paul, glowing with God-like enthusiasm, ceased itinerating the universe of God? Are Peter and Ayperian and Edwards and Payson and Evans idling away eternity in mere psalm-singing? Heaven is a place of restless activity, the abode of never-tiring thought. David and Isaiah will sweep nobler and loftier strains in eternity, and the minds of saints, unclogged by cumbersome clay, will forever feast on the banquet of rich and glorious thought. My young friends, go on then; you will never get through. An eternity of untiring action is before you, and the universe of thought is your field."

NEW WEAPON.—The manufacturers of Sharp's breach-loading pistol have produced a new weapon, which though weighing but 24 ounces, is capable of bringing down a squirrel or a bird at a thousand yards distance.

THE "NO CARDS" MANIA.—The no cards mania is extending. The Canada papers attach "no cards issued" to their funeral as well as their marriage notices.

## THE MINING SHARE MARKET.

The Mining Stock Market for the past week has been inactive, especially in leading shares. The transactions have been mostly of a speculative character and in middle class stocks.

The Gould & Curry has declined a shade further and may now be quoted at \$5,500.

Ophir is held firmly at previous rates. A dividend of \$48 per foot was declared on the 9th instant.

Savage maintains last quotations. It closed at \$3,500.

Chollar is firm at a slight advance. A large quantity of ore from this mine is now being crushed, the result of which is anxiously looked for.

Sacramento has advanced about \$20, upon rumors of a compromise with the Meredith.

Considerable speculation has been noticed in the Pride of the West and Buckeye, both of Devil's Gate District, each of which is beginning to attract attention by reason of favorable developments at the mines. The shares of these Companies have advanced about \$50 to the foot, during the past week.

Wide West has been quite largely dealt in at improved, though fluctuating rates. It has been the favorite of the week, 342 feet having changed hands at \$160 @ \$200.

An increased attention is being given to Humboldt shares. It has been quite largely dealt in; 136 feet having changed hands the past week at rates varying from \$400 @ \$450. A quantity of ore from this mine, is now on its way to Freiberg, where it will be worked after the most approved German process, as a reliable test of the value of the mine.

The chief exciting mining topic of the week has been the abortive attempt to dispossess the present occupants of the Amaden Quicksilver Mine, by virtue of an obsolete Congressional Act of 1807. Fortunately for the State and country the attempt was foiled by a brief telegraphic correspondence with the President, who has stayed all immediate action in the matter.

Another matter of nearly equal interest, is the announcement of the transfer of the Mariposa Estate to a mammoth New York Company, who have organized with an issue of Shares representing Ten Millions of Dollars. The new Company assumes all existing liabilities of the Estate.

## THE COPPER INTEREST.

Copper still continues to absorb much interest, and the reports from the mines are quite as encouraging as heretofore. We have elsewhere thrown out a few hints which it may be well for all parties to bear in mind. An undue excitement will result in no general advantage, but may lead to much individual disaster.

A correspondent writes: "At Salt Springs, to the northward of Copperopolis, the D'Jue Company are taking out large quantities of black sulphurets of copper from a vein seven feet in width. One interest of 200 feet in this mine has been sold for \$4,000, within ten days. The New Era Company who hold the extension on each side of the D'Jue, are sinking on their South claim, and at a depth of about sixty feet have struck the same indications. Negotiations are now pending for the purchase of their North claim by the agent of some Parisian capitalists who have recently arrived here. The D'Jue and New York Co's expect soon to have ore on hand for shipment."

In Plumas and Placer Counties, a like excitement exists, and shafts are being sunk and tunnels run with some prospect of success.

There are now numerous buyers of copper ore in the market, deliverable in this city, for shipment East. The California Smelting Co. are also buying for their works at Antioch.

The Union, so far, is the only dividend-paying copper mine.

The Oriental has sufficient ore on the surface to pay all expenses to date, and leave a surplus. They will soon commence shipping. Several Companies will soon commence paying dividends.

## GENERAL MINING STOCK REPORT.

## REPORT OF BIDS

At the San Francisco Mining Stock Board,

For the week ending July 11, 1863.

## THEATRICAL.

McGuire's Opera House, the present week, has been occupied, up to Thursday night, with "Lady Audley's Secret," a dramatised version of Miss Brandon's novel, by Miss Western. No piece, in our opinion, has been presented to the public, more deserving of the patronage it has received. It is, throughout, artistic, harmonious and truthful. The performance has been highly meritorious.

On Friday a new piece, called the "Declaration of Independence of 1776," by Mr. Howe, a well known resident of this city, was presented. From an omission of the usual compliments, we are not at present able to report upon its merits.

THE EUREKA.—The Minstrels, this week have given their usual amount of fun, and received in return a corresponding amount of patronage. Two new pieces of interest have been presented. The one a song by a member of the Fire Brigade, in answer to the popular

## THE BRYAN BATTERY.

The vast interest involved in the reduction of ores on this coast, renders it of the highest importance that the Machinery employed for this purpose should be of the most Effective, Economical and Durable Character. It may be safely said that Millions of Dollars have already been spent upon the various experiments in this class of Machinery, and it is a fact well known to all who have had any practical experience in the matter, that every new process developed during the past twelve years, has been set down as a failure. The Ordinary Stamp Battery

### ALONE STANDING THE TEST.

This, with the Improvements which Experience has suggested, is now regarded, by common consent, as the only reliable

### METHOD OF CRUSHING ORE.

THE BRYAN BATTERY, as now constructed, is believed to combine all the improvements which the experience of the past has afforded. They have been

### EXCLUSIVELY ADOPTED

by many of the most prominent Mining Companies in the country, and have been, for the three past years, subjected to the severest of all test—that of constant use—and in every case has been pronounced

### EFFECTIVE, SUBSTANTIAL AND RELIABLE.

They are now extensively used throughout the mineral regions of California, Nevada and Mexico, and have established a claim to public confidence, never yet equalled in any piece of machinery.

These Mills are constructed almost entirely of Iron, and, consequently, are not affected by the intense heat and dryness of atmosphere, common to all mining localities. They are adapted to

### BOTH WET AND DRY CRUSHING,

and are warranted to reduce, with the same weight of Stamps, 25 per cent, more rock than any other mill in use. Each Battery is complete in itself, and forms a perfect mill—while any number of them can be added at a subsequent time—thus preserving the symmetry and uniformity of the Mill

As an evidence of the increasing favor with which these mills are regarded, we would mention that the Celebrated Ophir Company first introduced them into their works in 1860, and have been adding a number of Batteries, each subsequent year, until they now have Nineteen, running Seventy-six Stamps.

They are perfectly fitted and set up at our Works, before shipping, each piece being marked and numbered, so that they can be put up and set at work in ten hours after arriving on the ground. They are made of two sizes with four and five Stamps, etc. The Four Stamp Battery weighs, when complete, about 6,000 pounds, and the Five Stamp about 7,000. The Mortar Bed, when desired, is cast in sections, so that the mills can be packed over any mountain road.

We annex the names of a few well known Companies who have adopted them—running from four to seventy-five stamps each—to whom reference is made:

Ophir Mining Co., Washoe Valley,  
San Marcial Co., Mexico,  
John D. Winters & Co., Esmeralda,  
Crown Point Co., Gold Hill,  
Potosi Mining Co., Virginia City,  
Tajo Mining Co., Mexico,  
Sheba Mining Co., Humboldt.  
Lotta Mills Co., Coso.  
American & Mexican Co., Mexico,  
San Carlos Mining Co., Owen's River,  
Union Quartz Co., Aurora,  
Triunfo Mining Co., Mexico,  
Napa Quartz Co., Aurora,  
Petaluma Quartz Co., Gold Hill,  
Francis Mellus & Co., Slate Range,  
W. R. Churchill & Co., Mexico,  
Willow Springs Co., Coso,  
Hews, Howe & Co., Rich Gulch Flat,  
F. A. Benjamin & Co., Mexico,  
O. J. Parker & Co., Nicaragua,  
Gibbons & Clayton, Esmeralda,  
Smith & Clouser, S. F. Reduction Works.  
Amagoza Mining Co., San Bernardino,

### MANUFACTURED ONLY BY

**GODDARD & CO.,**

At the Pacific Iron Works.

SAN FRANCISCO.

on 125 to 136 First street, and 126 to 144

Fremont street.

P. DONAHUE. H. J. BOOTH. C. S. HIGGINS.

## UNION IRON AND BRASS FOUNDRY.

(The First Established in the State.)

CORNER OF FIRST AND MISSION STREETS, SAN FRANCISCO.

**HAVING ADDED TO THE SEVERAL** Departments all the recently improved Tools, this Establishment is now the most Extensive and Complete of any on the Pacific Coast.

The undersigned are prepared to furnish, at short notice, Locomotive, Marine and Stationary Engines, of every size and description.

### BOILERS.

Locomotive, Flue, Tubular, Upright and Cylinder, furnished with or without engines, complete. Machinery and Castings of every description, Saw-mills, Grist Mills, Car Wheels, Derrick Irons, etc.

**QUARTZ CRUSHING BATTERIES,** Embracing a great variety of Stamp, Mortar and Cam Patterns.

**AMALGAMATING MACHINERY,** Varney's Improved Patent Pans and Settlers, Wakely Pans, Amalgamating Tubs, Plated's Grinders, Chile Mills, Concentrators, etc., etc.

### MINING PUMPS.

Cornish, Lift and Force Pumps, from four to eight feet stroke, with Pipes, Bob Mountings, and Gearing complete.

### HOISTING DRUMS.

For Shafts or Inclines, with clutch, friction or V cone S Sole Agents and Manufacturers for the Pacific Coast, O. C. and G. M. Woodward's Celebrated Patent Steam Pumps and Fire Engines.

All Contracts and Orders executed with promptness and dispatch, and at reduced prices for Cash.

je21 DONAHUE, BOOTH, & CO.

### Giffards Injectors,

**FOR SUPPLYING BOILERS WITH FEED WATER** without Pumps. No Mill or Mining Company should be without one of these valuable instruments. Send for a Circular.

DAVID STODART, Agent.  
je22 Cor. Pine and Front Sts., San Francisco.

### I. C. E. KLEPZIG & CO.,

## GUN MAKERS,

### DEALERS IN GUN MATERIALS,

733 Washington street, San Francisco,  
[One Door above Kearney street.]

Repairing done in a workmanlike manner at the shortest notice.  
Gilding, and also Silver Plating, by E. Ekland. je21

### CORNELL'S

## EXCELSIOR GALLERY,

650 Washington st. Three doors below Kearny.

Having refitted the above rooms the undersigned is now prepared to furnish the public with a superior style of Picture, at a lower price than ever before offered in the city.

### CARD PICTURES.

As I have every facility for producing these beautiful pictures, in all their different varieties, I have reduced the price to

**\$3 PER DOZEN AND \$2 PER HALF DOZEN!**

Large size Photographs. \$3—Extra copies \$1 each.

AMBIOTYPES in All Styles and Prices.

OLD PICTURES copied with care and accuracy, in any style desired. Particular attention paid to pictures of Children.

Pictures painted in Oil or Water Colors, and retouched in India Ink by a competent artist.  
je22 R. H. CORNELL.

## BAUNCHEIDTISM,

THE PRESERVER AND PRODUCER OF LIFE.

**THE EFFECT OF BAUNCHEIDTISM AS A METHOD OF** curing disease, is a "fait accompli" in medicine, and needs no more proof. The public has crowned Bauncheidtism already with an extraordinary patronage, and it is acknowledged by all men of science that BAUNCHEIDTISM is founded on a rational, scientific basis.

It can safely, and with sure success be applied to paralysis in consequence of Apoplexy, Podagra and Rheumatism of every description, which kind of complaints can find their only relief by the above method.

Especially can it be applied successfully, in the spring of the year to diseases of the eye.

Dr. Borchers is the only doctor in California who has the original series of Dr. BAUNCHEIDT and his original oil. Dr. Borchers is also in possession of original letters of the inventor of the method by which he can prove that he is perfect master of the latter.

DR. J. C. BORCHERS.

No. 19 Kearney street, and No. 4, Mark's Place, First story, No. 5. Office hours from 9 to 11 A. M., and 1 to 4, and 7 to 9 P. M. je21

## P. M. S. CO.

PACIFIC MAIL STEAMSHIP COMPANY'S line to PANAMA, connecting via the Panama Railroad with the steamers of the Atlantic and Pacific Steamship Company at Aspinwall.

### FOR PANAMA.

The following Steamships will be dispatched in the month of May, 1863.

July 3d, - - - - Stermer Golden Age

July 13th, - - - - Steamer St. Louis

July 23d, - - - - Steamer Constitution

Will leave Folsom Street Wharf, with Passengers and Treasure, for Panama

AT 9 O'CLOCK, A. M., PUNCTUALLY,

And connect, via Panama Railroad, at Aspinwall, with steamships for New York.

For Freight or passage, apply to

A. B. FORBES, Agent.  
je4 Corner of Sacramento and Leidesdorff sts.

## WHEELER'S

### Amalgamating and Separating Pans.

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of triturating, and in cleaning up. By the introduction of the Separating Pan to flow the triturating loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated on the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

These Pans can be seen in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves.  
2016-1f ZENAS WHEELER.

## A. ROMAN & Co.,

WHOLESALE AND RETAIL

### Book Establishment,

417 and 419 Montgomery street,  
SAN FRANCISCO.

Orders respectfully solicited and promptly attended to. A Treatise on Metallurgy, Comprising Mining and General and Particular Metallurgical Operations, etc. Etc. By Frederick Overman.

A Manual of Metallurgy, or A Practical Treatise on the Chemistry of Metals. Records of Mining and Metallurgy, or Facts and Memoranda for the Use of the Mine Agent and Smelter. By James Phillips and John Darlington. Manual of Metallurgy, more particularly of the precious metals; but including such others as are employed in dental practice.

Piggott on the Chemistry and Mining of Copper. Practical Mineral Assaying and Mining. Overman. Gold Mining and Assaying, by Phillips. Miners' Companion and Guide, compiled by Silversmith. Assayers' Guide, or Practical directions to Assayers, Miners and Smelters.

Practical Assaying, by Michell. Liver Ores and Silver Mines, by Pro. Blake. Ure's Dictionary of Arts, Manufactures and Mines. Weisbach's Mechanics of Machinery and Engineering. Nevill's Hydraulic Formula Tables. Fresenius' Chemical Analysis.

Together with many other works in this and similar lines

Books imported to order on short notice. A. ROMAN & Co.  
417 & 419 Montgomery Street.

## P. M. STEAMSHIP COMPANY.

### NOTICE.

Until further notice, the Steamers of Pacific Mail Steamship Company will hereafter be dispatched on the

3d, 13th and 23d of each month.

When any of the above dates fall on Sunday, the steamer will be dispatched on the following Monday.  
A. B. FORBES, Agent.

## Wm. P. TAAFFEE,

IMPORTER AND JOBBER OF

### Staple and Fancy Dry Goods,

CARPETS, DUCK, ETC.,

Cor. Front and Sacramento streets,

SAN FRANCISCO.

## REYNOLDS'

### Patent Cut-Off and Governor FOR STEAM ENGINES.

127 of these Invaluable Machines,

### ARE NOW IN USE

In California and Nevada Territory, giving a perfect regular motion and Saving 20 to 65 per cent of the Fuel.

### Steen's Improved Governor

Is the CHEAPEST, SIMPLEST and QUICKEST to adjust least liable to get out of order of any Governor in use. It can be seen in operation at the Golden State Iron Works, and at the Stone Breaker, foot of Market Street San Francisco.

### Clark's Steam and Fire Regulator,

For controlling the Draft or Blast by opening the Chinney or Valve in the Blast Pipe by the pressure of the steam in the boiler. It will regulate the pressure to pound, on the square inch. It CANNOT get out of order and any person can put one up in an hour after the danger is put in.

### Ingersolls Patent Drill Press,

With which drilling can be done the same as with the common ratchet, and when small holes are wanted, can be done four times as fast. The handle can be worked in any direction.

### Felt for Steam Boilers, Pipes, Etc.

At the lowest market rates.

### Steam Engines, Boilers, Pipes,

Hydraulic Presses, Shafting, Pulleys, Etc., at the low market rates.

### Anti Incrustation Powder,

A Sure Remedy for Scale in Steam Boilers, without injury to the iron. In use for the past EIGHT years.

Refer to—Sugar Refinery, San Francisco, Collett & Co., San Jose, L. A. Booth, Esq., Virginia City, and 2,000 others in the United States.

E. T. STEEN AGENT.

No. 33 Fremont Street, San Francisco.

## MINING & SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

THIRD YEAR! VOLUME VI.—NEW SERIES

A new volume of this extensively circulated paper commenced Sept. 11, 1862. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equally in interest and valuable information to any paper published.

### The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to its purpose, and of everything generally that may be of service to the Miner.

### The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, also of receiving any information that may be necessary in obtaining his patent, the proprietors having had great experience as Patent Agents, together with facilities at Washington that enable them to obtain Patents with dispatch.

### The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as its columns will from time to time contain original engravings of new machines and inventions, together with large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

### To Chemists, Architects and Millwrights

This Journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in the columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

### Terms.

To mail subscribers—Four Dollars per annum. Club Rates.  
Five Copies for Six Months, \$5.  
Ten Copies for Six Months, \$10.  
Ten Copies for Twelve Months, \$30.  
Fifteen Copies for Twelve Months, \$44.  
Twenty Copies for Twelve Months, \$56.  
For all clubs of Twenty and over, the yearly subscription is only \$2.80. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

BOWER & SMITH, Publishers.  
Room 27, (formerly) U. S. Court Building, Corner Washington and Battery streets, San Francisco.

## ESMERALDA.

A most unfortunate concurrence of circumstances seems to have operated, within a few months past, to greatly depreciate Esmeralda Stocks, and to destroy, to a great extent, the confidence of capitalists in this city in the value of the mines of that region. This depreciation, we have good cause for believing, has not been so much from a failure of the yield of the mines, as from the bad management of several of the leading Companies. There are not a few who openly impute improper motives, to some of the managers here spoken of. It would be difficult to convince a large portion of the Stockholders of the Wide West mine, that that mine might not under a proper management, have been made a dividend paying institution months ago, with its stock rating full one hundred per cent. or more, above its present market value. Of the facts in the case we know but little; we simply give the most current and commonly received impressions in Esmeralda, in justification of the claim set up for a fair average valuation of the mines of that region. In addition to the above supposed cause for reaction, much damage has unquestionably been done to good interests in that region by wild cat speculators, who have palmed off upon unsuspecting buyers in this city, thousands of feet of ground, utterly worthless, and which in many cases never had any other foundation than the paper upon which they were represented.

Another important reason for distrust in the mines of Esmeralda has undoubtedly resulted in the following just cause for complaint which we clip from a late number of the Esmeralda Star:

Thousands of ounces of bullion of gold and silver are continually leaving our town, for which we get no credit whatever. It is all credited to Washoe, simply because in crossing the Sierra Nevada it is sent by the Placerville route. We hope the Sonora road will soon be opened, and then Esmeralda and Bodie Districts will get the credit due them. It is from this fact, more than anything else, that our people have been averse to being thrown into the Territory.

The evidences appear to be conclusive that the Esmeralda region contains many rich and valuable mines, and it is a good cause of complaint that the bullion shipments from thence should be placed to the credit of other localities. The numerous well defined ledges, in that locality, the large amount of work done on them, and the amount of bullion known to have been taken out of them give unmistakable evidence of their value. It is idle to talk about failure in a region where such claims as the Wide West, Antelope, Del Monte, Utah, Garibaldi, Rambou, Ural, Crockett, Silver Hill and numerous other good and perhaps better claims are to be found.

Good will undoubtedly result from the present reaction in Esmeralda Stocks. The time has gone by when a few loose boulders can be made the basis of a mining operation, and wild-cat speculations can no longer carry into market their spurious stocks upon the prestige of such well known claims as those above enumerated. Already we notice a disposition in that region to fall back upon exclusively legitimate operations—to so develop the mines as to get good prices for their feet, instead of running to this city to dispose of

good feet for any price, by virtue of hard blowing. We have much faith in the concluding paragraph of a private letter before us, from a friend in Esmeralda, who writes:—"Give us good mills and honest men to work them, and we will show you bullion that will throw most other districts in the shade."

## THE COLORADO GOLD REGION.

Considerable activity is now being manifested in working and developing the Gold Mines of Colorado Territory. The Miners' Register, of a late date, published at Central City, in that Territory, gives the following interesting items:—

"YIELD OF THREE QUARTZ MILLS.—Messrs. Lee, Judd & Lee cleaned up from their Black Hawk, Eagle and Tiger mills, during the week ending May 2nd, \$4,782. During the week ending May 9th, \$5,434, making a total of \$10,216. We doubt whether any of our eastern capitalists can boast of a greater income than this. It is at the rate of \$265,626 per annum. We know of no reason why they should not do as well in the future as they have hitherto. Such are the results obtained from small beginnings in this land of gold.

SOLID GOLD.—J. Q. A. Rollins showed us yesterday a specimen of solid gold, taken from Gold Dirt Lode in '60 which weighed over (90) dollars. This is the largest natural piece we have ever heard of as having been taken from a lode in this Territory. This lode furnished several of a smaller size soon after its first discovery.

BEAUTIFUL SPECIMENS.—We saw a few days ago, at Horton, Pratt & Co.'s, a very fine gold specimen, from the Perrin Lode, taken out at the depth of about twenty feet. It was a piece of thoroughly burned quartz colored with oxide of iron. Wire gold could be seen all through it. We have long known the lodes of Russell's Gulch to be rich, and this is another proof of it. We were also shown another specimen from the Patch by Hon. H. F. Parker, containing several dollars in solid mass. It was contained in a seam of quartz passing through a block of granite. But few finer specimens have ever been found in the country.

GAYLORD'S PURCHASE ON THE GREGORY LODGE.—There have been some important changes in the ownership of property lately. Among them we may name the purchase of the Parker Mill property by W. E. Gaylord, of Washington, D. C. This mill is conveniently situated in Nevada Gulch, and has an abundant supply of water. Its number of stamps is to be increased to twenty-four. The mill is to be re-erected and put into complete running order. Mr. Gaylord also purchased a number of valuable mining claims; among which we may specify some eight hundred feet on the Nevada Lode, which runs within sixty feet of the mill and can consequently be worked—so far as elevating quartz and water goes—by the mill engine. This lode promises very well. It was first discovered by mining the gulch which runs along its course for several hundred feet, and was in this way uncovered for a long distance. The sulphurets crop out so far as it has been traced. Mr. Gaylord has also purchased a valuable tunnel claim, which enters the mountain at the mill. The tunnel crosses all of the most valuable lodes on Quartz Hill, and if properly pushed will be a fine thing."

## MINERAL WEALTH OF SOUTHERN CALIFORNIA.

Until very recently but little attention has been paid to the development of the mineral resources of Southern California. Operations have hitherto been confined to mere surface explorations. Scarcely a shaft has been sunk beyond twenty-five or forty feet deep, or a tunnel run any greater distance into a hill or ledge. Even these superficial explorations have been limited, and confined to but a very small number of even those veins whose existence has been observed. Still, the specimens obtained compare favorably with those from any other locality, either in the State or adjoining territories. An accumulation of such specimens would form a collection, which, for variety and richness, would compare favorably with almost any cabinet in the world. Gold and silver bearing quartz, copper ore in all its varieties, cinnabar, tin and other ores have been found in this region, in great profusion, and the country only needs a few more thorough and go-ahead miners, with a reasonable amount of capital to develop as rich a mineral country as can be found on the globe. We would include in that region of which we are speaking the Owen's River and Coso country, Slate Range, Tehachape, Soledad, Holcomb, Valley, Mohave, the region about San Bernardino and the mountain range back of, and to the Southward of Los Angeles, in which are located the Temescal tin mines.

Well authenticated reports from this region, from highly intelligent and practical sources, unite in placing the highest estimate upon its mineral value. The scope of country included within the limits above described is not less than 500 miles in circuit, and a richer field for exploration can scarcely be found.

The letters which we are publishing from Mesquit Spring, one of which will be found in the present issue, are descriptive of the North-western Section of this region. The mineral developments of that locality are of the first order, as will soon be proven by ores which are now on their way to this city, in large quantities, for treatment here. Our correspondent there, will doubtless keep our readers posted in regard to the developments in his neighborhood. We have for some time been intending to prepare a series of papers descriptive of the Owen's River and Coso Country, comprising the North-eastern sections of this region, for which we have already an abundance of data. (Our correspondent there will please excuse us for the delay. We have not forgotten the mutual promise.)

The attention of capitalists is already being directed to this portion of our State, and we understand but little difficulty is found in making arrangements between capitalists and miners, whereby an abundance of means is being secured, by the latter, for partial interests in their mines, to properly open and develop them, with the ultimate erection of machinery. Miners in that region should lose no time in reducing their claims to shares. It is by such means only, as a general thing, that moneyed men can be induced to take hold of them, and their real value be properly developed.

In many parts of Pennsylvania the people are growing an excellent substitute for tea.

## MINING CORRESPONDENCE.

NOTES OF A TRIP TO SLATE RANGE via LOS ANGELOS AND EL PASO.—No. 6.

## SUPPLIES FOR A PROSPECTING PARTY OF THREE.

Two No. 1, 3-ft pole picks, 1 drifting pick, 1 short and 1 long handle, 1 round-pointed shovel, 4 to 6 steel gads, 1 8-ft cast steel sledge, 1 good hatchet, 1 good horn-spoon, 1 or 2 leather specimen-bags, 3 3-quart, blanket covered, iron canteens, wide straps over the shoulder; revolvers and a double barrel shot gun, with plenty of powder, caps and course powder for rabbits, 1 6-quart iron camp kettle, 1 4-quart do., lined with tin or a stew pan lined with porcelain or tin, to stew fruit in, 1 1-gallon iron coffee pot, riveted in every portion, with cover and strong bail, no nose except a little bend in the rim, 1 bake kettle, 1 frying pan, 1 large, tin, bread pan, 4 tin plates, 4 tin cups, spoons, knives and forks, 1 large iron spoon, 1 iron ladle, 4 tin, soup, quart tins with handles; some wire to make pot-hooks; good grub for three months—100 lbs. bacon and ham, No. 1; 200 lbs. flour, 100 lbs. beans, 25 lbs. rice, 25 lbs. dried apples, 25 lbs. peaches, 100 N. O. sugar, 2 doz., P. & M's yeast powders, 25 lbs. green coffee, 5 lbs. tea, a box coffee mill, or the coffee can be tied in a bag and be beaten quite fine, between stones, 1 lb. of pepper, 20 lbs. salt.

I would also recommend that the prospector take along small quantities of lard, ginger, allspice, cinnamon, nutmegs, pickles, catsup, and also a gallon of vinegar, also a keg of syrup. But these are all luxuries which can be easily dispensed with.

In the line of clothing, one pair heavy blankets and one pair of light for each person; a few articles of stout miscellaneous clothing, 2 prs. of heavy boots, well nailed, also two papers of tacks.

My daily wear is an old soft hat, with ventilators all around it, a hickory shirt, a pair of denim overalls and a pair of wooden soled brogans, with rawhide well nailed on the bottom; after sundown I put on a blue flannel overshirt. This is all the clothing I shall need till November, then I will probably want an undershirt and a pair of drawers, or a pair of cashmere pants, with an old coat to put on occasionally.

A tent is a great convenience. Ours is of the U. S. A. pattern,  $7\frac{1}{2}$  by 10, (cost \$10,) plenty of room for four to sleep in.

I would add to the above, a full set of apparatus and chemicals for the reduction of ores.

I have, probably, been somewhat liberal in my calculations for supplies, but at this distance from civilization, it will be well to be amply provided against contingencies.

I will conclude this letter by giving a few incidents, such as are daily occurring here, and which will give your readers a better idea of the country, than could be obtained from three times the same space devoted to descriptions.

## INCIDENTS.

I will mention some circumstances which often occur on on this road: Last week a man from San Bernardino via Los Angeles, came on to the Desert Springs, with a riding horse and a mule packed with grub and tools. He turned them out at night, as usual, and in the morning they were missing. He soon found their trail leading directly across the Great Mohave Desert towards San Bernardino. He procured a horse and started after them. The horse gave out after going five miles; he tied him to a bush and then started on the run, barefoot, on the burning sands. He ran about 3 miles, and then crawled back almost entirely exhausted. He had no food or water with him and had he continued on an hour longer he never would have got back. His animals probably perished, for it is supposed to be impossible to cross the Desert without carrying food and water for animals.

A Mr. Wall, from Stockton, came in last week from Slate Range. He had wandered from the trail, on a very fine riding mule and became nearly exhausted; was without food or water 24 hours. His mule's hoof split in consequence of a break in the shoe and could only walk by binding the riatta around the foot and as soon as it wore off and again. He laid down to rest two or three times and soon was asleep, when his mule took him by the shoulder and raised him to his feet. He has been told that had he slept long he would have awakened with a heavy fever

on him, been deranged and lost. He had to leave his mule 20 miles back on the road and come in to my tent.

About three weeks since an ox-teamster stopping at Desert Springs, went out to collect his cattle and found two missing; he rode over the hills and found two Indians and a white man driving the two before them. He gave chase, though he had no arms with him, and they fled. He drove his cattle back and sent a man to the Company of Soldiers, then stopping at Grape Vine Springs, tried to get them to go out and take the party, as they had plenty of horses, but the soldiers would not start a foot. Two weeks since my partner wishing to come here from Slate Range, started in the afternoon, expecting to travel all night, as all try to do in crossing the dry alkali and salt lakes between this place and that. He traveled with a man who had a two-horse team and a light wagon. Towards morning they unhitched their horses to let them rest or browse, and laid down themselves. They soon concluded that the horses would travel off for water or food, and they turned out to hunt them in the dark. My partner, half asleep, soon espied two horses moving towards Slate Range, and he ran around and came in ahead of them and yelled "whoa!" just as he noticed two men on the horses, with their revolvers pointed at his head. They had noticed his movements and were ready for him, supposing him to be an Indian. The sound of his voice showed them that he was no Indian and he soon explained his object and mistake, and the travelers passed on.

A few days since five Indians came into camp at Laurel Hill, about starved. They were a portion of the party who went from Tehachapa to assist the Owen's River Indians in their late war with the whites. They cannot go to Tehachapa, where their squaws are, as the residents will kill every one of them, and they will wander about till some parties not so tender hearted as ours, will use them for rifle targets.

Night before last Mr. Griff Williams was lying in J. A. Talbott's cabin, reading a paper, and feeling something crawling on his whiskers caught it and squeezing it he felt a sharp pain. On opening his hand out fell a large light green scorpion, which had stung him on the fore finger. He immediately applied wet tobacco. The whole hand swelled some and pained him for three hours, then ceased and in the morning he could find nothing but a little black spot, where the sting entered. This goes to show that they are not dangerous. Perhaps at a later part of the season, they may be more poisonous.

C. W. T.

MESQUIT SPRINGS, JUNE 15, 1863.

## A CALIFORNIA INVENTION.

The Stockton Independent speaks of a new "Harvester," a California invention, in successful operation on a ranch about two miles from the Wat rloo House on the Calaveras. This machine is the invention of a Mr. Marvin, and with the labor of three men and 12 horses, is able to cut, thresh and sack the grain produced upon ten to twelve acres, per day. On the 10th inst. its day's work resulted in the cutting, threshing and sacking 300 bushels of wheat. The machine was built with more reference to durability than ornament, yet is neat and as light as the character and amount of work it is required to perform, will permit. Its cost was nearly \$1,200. The machine is said to work most admirably and has been endorsed by all practical farmers who have witnessed its operation, as the best in use.

## METALS.

The price of copper, at the present time, at the East, is 31 cents per pound.

Tin is selling at 42 cents. A year and a half ago it was commanding but 28 cents in New York.

Lead is now worth 8 cents in New York. There has been an unusual demand for this metal, for the last year, for military purposes.

Zinc is worth 7 cents. About 3,000 tons of this metal are consumed in the United States, a little over one half of which is the product of domestic mines.

Iron of all kind is in great demand at the present time. The production of this metal at the East is being pushed with all possible vigor. Pennsylvania pig is worth \$30 to \$32 in New York.

Cast steel, for mining purposes, in this State, is very scarce and held at 40 cents per pound. Of late, supplies have come to hand via Isthmus, and more ordered. Steel of ordinary sizes quotable at 25c. Nails have advanced to \$4 50.

## SPECIAL NOTICE.

•Some weeks since we forwarded blank receipts to such of our subscribers as are in arrears for their subscriptions. Some have promptly answered by remittances of the amounts due; others have notified us of special contracts with our predecessor, or of full payments made to him and not credited on our books. Where payments have thus been made, we have, in every instance, allowed them. There are quite a number, however, who have returned no reply to the bills which have been sent out. We trust all such will respond immediately upon seeing this notice. If payments have been made, we wish to be notified of the fact, so that due credit can be given; and if there are any to whom the paper is now sent who do not wish to continue it or do not intend to pay their subscription, we hope they will notify us of the fact so that we may discontinue sending papers to them. We do not wish to crowd the paper upon any man. All the names upon our list have been placed there, as subscribers, upon what we have deemed good authority. If any party, not considering himself a subscriber and in arrears, has received a bill for subscription, he will confer a favor by notifying us immediately of the fact. Postmasters are also reminded of their duty to return a paper that is not called for, etc.

It is stated that Gens. Grant and Pemberton were, some years ago, both lieutenants in the regular army, and belonging to the same regiment. They were stationed at Detroit. We have also heard it stated that they married sisters. The wife of the latter, the telegraph has announced, was killed, during the bombardment, by a bursting shell.

SCARCITY OF WATER.—The water, from the melting snow is already beginning to dry up in many portions of the mines. The indications are that the placer mining will be a very short one this year. The miners in quartz, however will be proportionally benefitted. What is death, or at least an important drawback to one, is life to the other.

ACID MANUFACTORY IN NEVADA TERRITORY.—Messrs McKeeley, Ross & Frazer, are about erecting an establishment in Carson City, N. T., for the manufacture of acids such as are used in the mills and assay offices of that Territory. The works will be in operation in about one month from this time.

BOILING MEAT.—It is the statement of Dr. Lankester who is the best authority, that albumen is contained in all meat; and if you put meat in cold water it gradually exudes but if you put it directly into boiling water, you produce a covering of coagulated albumen around the meat, which keeps in, to a considerable extent, the creatine and all the precious products of the juice of flesh. The water should boil; that is, it should have a temperature of 212°, and be kept at that heat for ten or twelve minutes; then the heat may be reduced to 140°, and kept at this heat until the whole is cooked.

The valley of the Connecticut River will this season be appropriated almost exclusively to the culture of tobacco. In 1860 over six millions of lbs. of tobacco were raised in the State, and this year the amount will probably be doubled, which, with the price also doubled, will render profitable returns to the producers. Connecticut is the tenth State in the Union in the amount of tobacco raised.

TO PREVENT KETTLES FROM RUSTING.—Dr. Osborn says that crusty deposits which gather on the inside of kettles used for boiling water may be prevented by placing a common clay marble in each kettle. The deposits having greater affinity for the marble than the sides of the kettle gather around the former and increase its hue, while the latter are left as bright and clear as when new.

THE NEW GOLD FIELD.—Accounts from Arizona are very flattering about the recent discovery of gold placer digging on the Frio, a tributary of the Gila River. It is asserted that they equal the American River in 1848. However it may be, certain it is that good placers have been discovered. Mr. Krenberg, a gentleman of scientific observation, who has made that country a study for years, predicted months ago that the next great gold-field would be Arizona. Still further on than the previous discoveries, he says, richer diggings still will be discovered. The facility of access and the favorableness of the climate will place these diggings, if rich as reported, far ahead of the Northern mines.

A NEW GOLD SAVER.

The invention consists of a grand pan probably three feet in diameter on the bottom, widening out towards the top, and about sixteen or eighteen inches in depth. The pan has a bottom of peculiar construction, and in it, all the crushed quartz that comes from the stampers is ground by a process we will attempt to describe. The water and the crushed quartz pass through a heavy iron apparatus that revolves horizontally. Upon the bottom of this are shoes ingeniously arranged to grind the particles of rock to an impalpable powder in the bottom of the pan which is covered to some depth with quicksilver. The shoes work over the entire bottom of the pan. Between the revolving cylinder and the rim of the pan is a space of some eight inches or more, divided into two parts by a hoop or bottomless pan, which extends down to the quicksilver allowing the grinding *feet* to move around under it. The appearance on the surface of the concern is that of two pans, one within the other and four inches from it, and a cylinder of iron revolving around the inner one. Between the cylinder and the inner pan is a space of, say, four inches, in which the water and dirt is violently agitated by the moving cylinder, but between the outer and inner pan the water is still, and this still water is one of the best features of the invention, as it enables all the finer particles of gold to settle there. The water discharges from a depression in the top of the grand pan, and mercerized copper plates over which it flows for a distance of fifteen, feet afterwards show not a trace of gold—a pretty sure indication that the pan does the work for which it was designed. A glass of water dipped from between two pans, when allowed to settle, exhibits a mud almost as gritless as soft soap.

The machine runs constantly without any care, and it is reported that it never clogs or gets out of repair except by the natural wear of the parts. Some men, professedly familiar with quartz mining, are sanguine that the machine is just what has been required to save gold, and predict for it great success. It looks simple, cheap and rational, in any aspect in which it may be viewed, and it is claimed that experience so far in its use demonstrates its superiority over any other apparatus for saving gold.

Maguire's Opera House.—During the past week the performances have consisted of a judicious selection of Tragedy and Comedy, giving to all the actors a good opportunity of showing their peculiar *forte*. The acting has been excellent. In our opinion, Mrs. Edwin has lately shown a tragic talent which no other actress in the State possesses. Miss. Sweet, also, has taken a more prominent position, and acquitted herself well. While the Management continue their present exertions, they need not be apprehensive about patronage.

THE INTERNATIONAL HOTEL, under the management of F. E. WEYGANT, Esq., was never under a more full tide of success than at the present time. Situated on one of the principal thoroughfares of the city, and easy of access to all our river steamers, it presents a most desirable home for travelers and strangers from abroad. The hotel has recently been remodeled and supplied with new furniture, beds and bedding. The proprietor is well known as a gentleman ever anxious with regard to the accommodation and comfort of his guests.

ARCHITECT—Those intending to build, either private or public edifices, would do well to consult Mr. C. Geddes, as per advertisement. Reasonable prices, buildings designs suitable to the location, and substantial work, are the three great merits Mr. G. claims for patronage.

[illegible]

## THE CALIFORNIA SMELTING WORKS.

We are frequently enquired of with regard to the progress which the "California Smelting Works" are making towards the commencement of active operations. In reply to such numerous enquires we would remark that the Company appear to be somewhat reticent upon the subject, but from conversation with several parties connected with that institution, we have learned the following facts, which, we presume, we can lay before our readers without any breach of confidence.

The Company have erected one Reverberatory Furnace, capable of working about *fifteen tons* of ore a day. They do not intend to carry the metal through the refining processes, and complete the manufacture of copper. They will merely convert the ore into "regulus," an operation which they will perform as follows:—A given quantity of the different ores are turned into the furnace, the average of which must not assay over 10 or 12 per cent. The whole is well heated, and in the course of a few hours the furnace is tapped and the entire mass drawn off, in the condition of what is termed *regulus*, which will assay from 40 to 60 per cent. of copper, the percentage depending mainly upon the mixture of the ores from which it has been obtained.

The Company, we presume, will not commence operations until they have accumulated a supply of some 2,500 or 3,000 tons of ore at their works at Antioch. They are now purchasing ores at the rate of a *out* \$2 for each per cent. of copper the ore contains. They pay for;

11 per cent. ore \$22.  
12 " " " 25.

As we understand it, the Company prefer to purchase a low, rather than a high grade of ores; which fact, if it is a fact, will be particularly interesting to those miners whose ores rate, say from 10 to 15 per cent only. The Smelting Company will pay all charges of transportation, on the receipt of the ores at their wharf, which amount will be deducted from the purchase price, on settlement. Any shipment will be assayed, and paid for within two weeks from the date of its receipt. The Company have already made considerable purchases in Calaveras, Nevada and Yuba counties. We have no knowledge of the time at which they will commence smelting operations. That time will be governed entirely by the rapidity with which the ore comes in. It will not be profitable to commence smelting until about the quantity mentioned above has been received.

**OUT OF PRINT.**—We regret that we cannot furnish back numbers of the MINING AND SCIENTIFIC PRESS, containing the articles under the head of "The Miners' Laboratory," without going back to the first of November last. The unexpected demand for these papers has already drawn upon our regular files. We have still left, however, a few complete files from November last, which will be disposed of at the regular subscription price—four dollars from November, 1862, to November, 1863. To those who are not able to obtain the back numbers of the "Laboratory," we would say that we propose soon to reprint those papers, in a revised form. We have much other valuable matter in store for our readers, that are, and that are to come.

**ST. IGNATIUS COLLEGE.**—We have received a copy of the Annual Prospectus and Catalogue of St. Ignatius College, of this city. The college edifice is located on Market Street, between Fourth and Fifth. This literary institution was founded in October 1855, and, numbered at the close of the last term, according to the catalogue before us, 462 students. The design of the institution is to give a thorough Classical, Mathematical and Philosophical education. It was incorporated April 1859, and is fully empowered to confer degrees and academical honors in all the learned professions. The faculty and officers comprise thirteen gentlemen, under the presidency of Rev. N. Congiato. The next term commences on the 24th of August prox mo.

**FOR THE EAST.**—Two Ocean Steamers leave this port, on Thursday next, for the East. The favorite steamer *Moses Taylor*, under command of Capt. Blethen, takes her departure from Mission Street wharf, while the P. M. S. S. Co. dispatch the finest boat of their line, the *Constitution*, commanded by Capt. J. S. Watkins, at the same time, from the Company's wharf at the foot of Folsom Street. Fares will undoubtedly be low, and no doubt a large number will improve this opportunity, to visit the "old folks at home."

## COPPER MINING CORRESPONDENCE.

**EDITOR MINING AND SCIENTIFIC PRESS:**—Having recently made a trip through the Copper Regions of a portion of Nevada and Yuba Counties, I have thought that I may be able to give you a few items that may be of some value to your numerous readers, all of them, nearly, being either directly or indirectly interested in Copper Mining, which is rapidly becoming one of the most widely extended departments of Mining in the State.

At present there is scarcely a county in California but where indications of copper are found. The copper ore, also, of each district, possesses some marked peculiarity of its own. There is a wide difference between the outward appearance of the Calaveras county copper and that of Yuba and Nevada. Most of the copper, in the former county, is more or less mixed with slate; but in the latter counties, with few exceptions, it is found mixed with quartz. From all outward indications, Nevada and Yuba promise to turn out large quantities of fine ore.

The Wilson district, about seven miles from Lincoln, is being vigorously prospected by several parties, all of them, nearly, being fortunate enough to find the outcroppings, and other accompaniments of copper lodes. Thus far, however, but little copper ore, of any value, has been taken out. They have one shaft here, sunk to about 75 feet; but the copper ore is as yet of rather a low grade; but with proper care and attention would be easily concentrated at the mines.

The miners at the Zinc House district, about 12 miles from Lincoln, are also getting very flattering and encouraging prospects; and this district, I have no doubt, will create quite a stir before long, among copper speculators. Among the claims of this district, that of the Well Mining Company, is the best and most promising. This Company has a mass of ore, *about thirty feet in width*, and upon this mass they have sunk a shaft to the depth of about 35 feet in one place, and another shaft, at a little distance from the first, is down to the depth of about 30 feet. The quality of the ore is improving in percentage, every foot they go down.

There are several very good claims also, a few miles north of the Zinc House district, on the Green and Downey leads; among some of the best of which are the Eureka and Last Chance. Both of these claims are turning out very fine ore indeed; and were it not that it is a little mixed with quartz, the percentage of copper would be very high. There are several other claims on these leads or claimed to be on them, as I should have said, but they have not struck anything as yet, and I do not suppose it of any importance to give you a description of every hole the miners are sinking in expectation of finding copper, with as little chance of doing so as if they claimed Telegraph Hill, and mined the same for copper. In this district there are a few other claims which may turn out good, such as the Alabama, Mammoth, Duffy, Wild Irish and Confidence.

A few miles south of the Zinc House, is another copper district, called the Monitor. So far but one good claim has been found here, and that is called the Red Lead. Unlike the other claims, this copper ore is mixed with slate, and not quartz. There is no mistake but that they have a fine show here.

There is one remark I wish to make on copper mining in California, which is, that at not a single mine do they adopt any method, whatever, of *dressing their ore and separating it from the gangue*; and with few exceptions, but little care is taken in the shaft, to blast the rock in such a manner as to properly save the ore. In several of the claims I visited, *fifty per cent of the ore was lost*, by bad workmanship, and forty per cent. by not dressing their ores. It is a pity to see such a large quantity of ore being entirely lost. In a number of places, dirt, stones and ore are all dumped together, while by following your instructions under the head of the "Miners' Laboratory," the whole could be separated with but little cost. Copper Mining will not pay unless the miners will adopt some plan to save their ore. Could you not, Mr. Editor, give the miners a description of some cheap apparatus without much complicated machinery to separate the gangue from their ore?

T. PRICE.

SAN FRANCISCO JULY 18TH, 1863.

**CORRESPONDENCE—NECESSITY OF STUDY AND EXPERIENCE AMONG COPPER MINERS.**—In another column will be found a letter from Mr. THOMAS PRICE, descriptive of the progress of the Copper Mining interest in a portion of Nevada and Yuba Counties, which that gentleman has recently visited. Mr. P. is thoroughly posted with regard to Copper Mining in all its various phases, and his remarks are eminently worthy of attention. We would call especial attention to the concluding portion of his letter, on the importance of the manner of extracting the ore from the mines, and its proper manipulation and separation on the surface. We have heard similar remarks made by other experienced copper miners, with regard to the wasteful manner of handling copper ore at the mines, by parties, in this State, who have had little or no experience in such matters.

Copper mining like all other branches of industry, in order to be made successful, must be conducted under experienced management. The lack of experience in this branch of our mining interest will doubtless prove a great drawback to copper mining in California, for some years to come. That experience will be gained sooner or later—and all the sooner, in proportion, as our miners take the trouble to embrace all the means at hand to inform themselves with regard to the nature and *modus operandi* of their peculiar calling. *Scientific books* are but of small account in accomplishing this end. What is wanted is *practical information from practical men*. That information we are endeavoring to collect and spread before our readers. The letter we publish to-day and the article under our "Miners' Laboratory" of June 29th, will be found especially important in this direction.

Other articles will follow in due time, as we may be able to collect them from various sources. Probably but few of our readers are aware of the difficulties in the way on this Coast, or the time required for obtaining information of this class which may be really valuable. A multiplicity of duties, always attendant upon the starting of a new enterprise of this kind, has thus far prevented us from bestowing that attention upon our editorial labors which is desirable, and, in fact absolutely necessary, to make our columns useful. The encouraging and increasing favor with which our efforts have recently been met gives evidence that we shall soon be in a condition to make this paper, what such a journal should be, an indispensable companion to every one engaged in mining.

**THE MARY L. GARDINER.**—We have taken considerable pains to ascertain the facts in the case of the reported sudden advance of the stock of the Mary L. Gardiner, as given in our Esmeralda Stock Report of June 29th and July 6th. Letters from responsible parties in Aurora, assure us that there was no foundation whatever for the reported discovery of rich rock, or advance of that stock. Our correspondent writes that he was imposed upon in the matter, by one of the owners in the claim, "who has always, heretofore, been looked upon as a reliable man," and that he should take due precaution that such an occurrence shall not be repeated. We have reason for believing that our Stock Report for outside localities has been as correct and reliable as is consistent with the unsettled and fluctuating condition of such markets. Our chief regret is that our correspondent has not furnished us with the *name* of the party who has sought to, thus surreptitiously, make an improper use of our columns.

**MEXICAN ORES.**—The Steamer Oregon, which arrived on Wednesday last, brought up from Cape St. Lucas, 600 sacks of silver ore and 286 bars of unparted silver and lead.

**RICH COPPER DISCOVERY.**—The Ione Chronicle has the following: About one year ago, Johnson & Co., and McNeely & Co., of this place, discovered rich copper croppings near the old Boston store, on Dry creek, about two and a half miles north of Ione. As the ledge is on the Pico Grant, the discovery was kept quiet until the title was confirmed, when McNeely effected a compromise with the proprietors, and commenced sinking a shaft on his claim. On the 8th of July, at a depth of two feet from the surface, a lode of very valuable ore was struck. The vein is about five feet in width, and clearly defined. This lode is thought to be the richest yet discovered in the State, and runs through our town.

## THE MINING SHARE MARKET.

The Mining Share Market, during the past week has quite resumed its wonted activity. The transactions have been large and generally at well sustained rates.

The chief excitement of the week has been connected with the Ophir. This stock opened at \$2,400, a decline of \$30. Dispatches were received, on Thursday, that the mine had been seriously damaged by an extensive cave which commenced in the Mexican mine, adjoining, and gradually extending into the lower galleries of the Ophir. In consequence of this intelligence the stock gradually fell to \$2,000. Later and official advices are to the effect that but comparative little damage has been done. The loss of time at the mine will not exceed a week, while the supply at the mills is full three months ahead. The result of this latter intelligence has been to produce some improvement. The closing quotations are \$2,025. Four hundred and eighty-four shares have changed hands during the week.

Gould & Curry shares have improved somewhat, with small transactions, however. An improved dividend for the present month, is now more confidently expected than ever.

Chollar has materially improved—as high as \$1,072 having been paid to fill time contracts. We quote at \$960.

Hale & Norcross is quoted at \$1,900 @ \$2,000. Further developments, at this mine, are anxiously looked for.

Considerable business has been done on Buckeye Shares, Devil's Gate District. 856 shares have changed hands at \$10. This has been the "fancy" of the week.

ESMERALDA STOCK has been considerably delinquent, fluctuating and generally falling rates.

Wide West has been quite active at declining rates. Shares open at \$165, advanced to \$175, and closed at \$150. Favorable reports are received with regards to progress on the artesian well for this mine.

Silver Hill has been largely dealt in at prices varying from \$35.50 @ \$55.

Esmeralda is offered at \$20, Utah at \$65.

Sheba, declined from \$175 to \$165; recovered to \$285. This extravagant change is attributable to the fact that the ore from this mine, although very rich, cannot be worked by any process in this country.

De Soto, dull at \$70; Reese River, \$1; Josephine, \$9; Blue Ridge, (El Dorado) advanced to \$17; Melones, dull at \$5;

## COPPER.

We have nothing specially new in Copper.

Highly encouraging accounts are coming in from Del Norte county. The Drummond Co., Richland District, are sending down very rich copper ore, largely mixed with black oxide. The Company is sinking a shaft on a three foot lead, and have commenced two tunnels to open their mine.

The Pearl also in the same district, has a three foot lead, and are taking out rich ore, carrying much red oxide of copper.

Street rumors reach us of new developments at the Evoca. We have learned no particulars, but understand they are important.

A NEW KIND OF ROCK FROM REESE RIVER.—The editor of the Territorial Enterprise has seen a sample of rock taken from a ledge in the Reese River country, which promises to be of great value as an assistant to the mining interests. It is apparently a peculiar species of soap or free stone, soft, and easily cut with a knife or saw, free from grit, and resembling in appearance the mottled red and white pipe stone, quarried at a single point in the heart of Dakota Territory, and held sacred by all the Indian tribes east of the Rocky Mountains. This stone can be cut into any desired form with trifling labor, and is said to resist the action of fire as completely as the best fire brick. Should it prove to possess the qualities claimed for it, the cost of erecting furnaces in that region will be materially reduced.

The fifth quartz mill for Reese River is on its way to that silver region, and a large train of freight wagons is on hand for the same locality.

## GENERAL MINING STOCK REPORT.

## REPORT OF BIDS

At the San Francisco Mining Stock Board,

For the week ending July 18, 1883.

Names of Companies.	Total No. Shares.	Shares per \$100.	Par Value.	Monday.	Tuesday.	Wednesday.	Thursday.	Friday.	Saturday.

FINE PAINTING AND TALL CHIMNEY.—A beautiful painting in oil colors of the famous Gould & Curry mill has been on exhibition, the past week, in the show window of Jones, Wool & Co., on Montgomery street. This is one of the most complete establishments of the kind in the world; and the painting is a most superior piece of artistic work. The tall chimney which towers high over the building, is 115 ft. in height, ten feet square at the bottom, and four at the top. It has a handsome cut stone base ten feet high, and is capped in like manner. The chimney is a nice piece of workmanship, and is an ornament to the mill and a credit to the establishment.

RAILROAD BRIDGE.—The Sacramento Bee of the 14th inst. in noticing the progress of the work upon the Pacific Railroad, says the piles for the bridge over the American have already been driven for a distance of 400 feet into the river and that the progress, and the mountains of ready framed timber on the ground and on Front street landing,

## P. M. S. C. O.

PACIFIC MAIL STEAMSHIP COMPANY'S line to PANAMA, connecting with the Panama Railroad with the steamers of the Atlantic and Pacific Steamship Company at Aspinwall.

## FOR PANAMA.

The following Steamships will be dispatched in the month of May, 1863.

July 3d, - - - - - Steamer Golden Age  
July 13th, - - - - - Steamer St. Louis  
July 23d, - - - - - Steamer Constitution

Will leave Folsom Street Wharf, with Passengers and Treasure, for Panama

AT 9 O'CLOCK, A. M., PUNCTUALLY,

And connect, via Panama Railroad, at Aspinwall, with steamships for New York.  
For Freight or passage, apply to

A. B. FORBES, Agent.

Corner of Sacramento and Leidesdorff sts.

## WHEELER'S

## Amalgamating and Separating Pans.

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of triturating, and in cleaning up. By the introduction of the Separating Pan to flow the triturating this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

These Pans may be seen in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves.

5016-1f ZENAS WHEELER.

March 24, 1863.—At a meeting of the Board of Trustees, held this day, an assessment of Forty Cents per share was levied upon the Capital Stock of the Company, payable twenty (20) cents per share within thirty days, and twenty (20) cents per share within sixty days from this date, to the Secretary. By order of the Trustees,  
J. ARMSTRONG, Secretary.

## THE BRYAN BATTERY.

The vast interest involved in the reduction of area on this coast, renders it of the highest importance that the Machinery employed for this purpose should be of the most Effective, Economical and Durable Character. It may be safely said that Millions of Dollars have already been expended upon the various experiments in this class of Machinery, and it is a fact well known to all who have had any practical experience in the matter, that every new process developed during the past twelve years, has been set down as a failure. The Ordinary Stamp Battery

## ALONE STANDING THE TEST.

This, with the Improvements which Experience has suggested, is now regarded, by common consent, as the only reliable

## METHOD OF CRUSHING ORE.

THE BRYAN BATTERY, as now constructed, is believed to combine all the improvements which the experience of the past has afforded. They have been

## EXCLUSIVELY ADOPTED

by many of the most prominent Mining Companies in the country, and have been, for the three past years, subjected to the most severe of all tests—that of constant use—and in every case have been pronounced

## EFFECTIVE, SUBSTANTIAL AND RELIABLE.

They are now extensively used throughout the mineral regions of California, Nevada and Mexico, and have established a claim to public confidence, never yet equalled in any piece of mining machinery.

These Mills are constructed almost entirely of Iron, and, consequently, are not affected by the intense heat and dryness of atmosphere, common to all mining localities. They are adapted to

## BOTH WET AND DRY CRUSHING,

and are warranted to reduce, with the same weight of Stamps, 25 per cent. more rock than any other mill in use. Each Battery is complete in itself, and forms a perfect mill—while any number of them can be added at a subsequent time—thus preserving the symmetry and uniformity of the Mill

As an evidence of the increasing favor with which these mills are regarded, we would mention that the celebrated Onir Company first introduced them into their works in 1850, and have been adding a number of Batteries, each subsequent year, until they now have Nineteen, running Seventy-six Stamps,

They are perfectly fitted and set up at our Works, before shipping, each piece being marked and numbered, so that they can be put up and set at work in ten hours after arriving on the ground. They are made of two sizes, four and five Stamps each. The Four Stamp Battery weighing complete about 6,000 pounds, and the Five Stamp about 7,000. The Mortar Bed being cast in sections, when deiced, so that the mills can be packed over any mountain road.

We annex the names of few well known Companies who have adopted them—running from four to seventy-five stamps each—to whom reference is made:

Ophir Mining Co., Washoe Valley, San Marcial Co., Mexico.

John D. Winters & Co. Esmeralda,

Crown Point Co., Gold Hill,

Potosi Mining Co., Virginia City,

Pictures painted in Oil or Water Colors, and retouched in India Ink by a competent artist.

je22 R. H. CORNELL.

## BAUNCHEIDTISM,

THE PRESERVER AND PRODUCER OF LIFE.

THE EFFECT OF BAUNCHEIDTISM AS A METHOD OF curing disease, is a "fait accompli" in medicine, and needs no more proof. The public has crowned Bauncheidtism already with an extraordinary patronage, and it is acknowledged by all men of sense that BAUNCHEIDTISM is founded on a rational, scientific basis.

It can safely, and with sure success be applied to paralysis in consequence of Apoplexy, Podagra and Rheumatism of every description, which kind of complaints can find their only relief by the above method.

Especially can it be applied successfully, in the spring of the year to diseases of the eye.

Dr. Borchers is the only doctor in California who has the original series of Dr. BAUNCHEIDT and his original oil. Dr. Borchers is also in possession of original letters of the inventor of the method by which he can prove that he is perfect master of the art.

DR. J. C. BORCHERS.

No. 19 Kearney street, and No. 4, Mark's Place, First story, No. 5. Office hours from 9 to 11 A. M., and 1 to 4, and 7 to 9 P. M. je 21

## REYNOLDS'

Patent Cut-Off and Governor FOR STEAM ENGINES.

127 of these Invaluable Machines,

ARE NOW IN USE

In California and Nevada Territory, giving a perfect regular motion and Saving 20 to 65 per cent of the Fuel.

## Steen's Improved Governor

Is the CHEAPEST, SIMPLEST and QUICKEST to be used, and least liable to get out of order of any Governor in use. It can be seen in operation at the Golden State Iron Works, and at the Stone Breaker, foot of Market Street San Francisco.

## Clark's Steam and Fire Regulator,

For controlling the Draft or Blast by opening the Chimney or Valve in the Blast Pipe by the pressure of the steam in the boiler. It will regulate the pressure to pound, on the square inch. It cannot get out of order and any person can put one up in an hour after the dan per is put in.

## Ingersoll's Patent Drill Press,

With which drilling can be done the same as with the common ratchet, and when small holes are wanted, can be done four times as fast. The handle can be worked in any direction.

## Felt for Steam Boilers, Pipes, Etc.

At the lowest market rates.

## Steam Engines, Boilers, Pipes,

Hydraulic Presses, Shafting, Pulleys, Etc., at the low market rates.

## Anti Incrustation Powder,

A Sure Remedy for Scale in Steam Boilers, without injury to the iron. In use for the past EIGHT years.

Refer to—Sugar Refinery, San Francisco, Cottell & Co., San Jose, L. A. Booth, Esq., Virginia City, and 2,000 others in the United States.

## E. T. STEEN AGENT.

No. 33 Fremont Street, San Francisco.

## MINING &amp; SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

THIRD YEAR! VOLUME VI.—NEW SERIES

A new volume of this extensively circulated publication commenced Sept. 11, 1862. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper published.

## The Mining Interest!

Will find it of great value, as it will contain all the news pertaining to Mining, the prices and sales of Mining Stocks, new inventions, Machinery adapted to the purpose, and of every thing generally that may be of service to the Miner.

## The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietors having by great experience as Patent Agents, together with facilities at Washington that enable them to obtain faster with dispatch.

## The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as its columns will from time to time contain original engravings of new machines and inventions, together with large amount of reading matter pertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest our readers.

## To Chemists, Architects and Millwrights

This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Fishers will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

## Terms.

To mail subscribers.—Four Dollars per annum

Club Rates.

Five Copies for Six Months, \$3.

Ten Copies for Six Months, \$15.

Fifteen Copies for Twelve Months, \$30.

Twenty Copies for Twelve Months, \$44.

Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 50. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

**50 lbs. MARINE and**  
**Fire-Proof Paint,**  
MANUFACTURED BY THE PACIFIC METALLURGICAL Works in this city, for Hulls and Decks of Vessels from ground Mineral Rock contains Arsenic, Copper, Litharge and six other Minerals. When used on the Decks or Bottoms of Ships, it is equal to a coat of Stone, and quite equal to Copper, no worms will ever affect it, and cheaper than any other paint.

**DIRECTIONS:**  
For Decks of Ships, use two parts Mineral Paint, one part White Lead, mix with Linseed Oil.  
For Bottoms of Vessels, use one part ground sulphur, three parts Mineral Paint, mix with Coal Tar and apply it hot.  
For sale by all Ship Chandlers and Tradesmen, in boxes of 50 lbs. each, or by the Pacific Metallurgical Works.

**25 POUNDS FIRE-PROOF PAINT.**  
When used on Roofs, Buildings, or Fences, it is equal to covering them with a coat of Stone, being perfectly Fire Proof, and costing less than any paint.

**DIRECTIONS:**  
**HOUSE:**—Mix three parts Mineral Paint with one part white lead, thin with Linseed oil; if a lighter color is wanted, mix less paint, more lead.  
**ROOF:**—Five parts of Mineral Paint, one part white Lead; mix with Linseed oil. Put it thick on a tin Roof as one coat when properly applied will last three years.

## TREATMENT OF SULPHURETS.

Plattner's Chlorine Gas Process for Treating Auriferous Sulphurets, as Employed by Mr. Deetken, at his Metallurgical Works, on the San Bruno Road, near this City.

We had the pleasure, a short time since, of paying a visit to the Metallurgical Works of Mr. G. F. Deetken, on the San Bruno road, about two miles south from this city. Mr. Deetken has established himself at this point which is convenient of approach, both by land and water, for the purpose of working auriferous sulphurets, after Plattner's well known process, but by mechanical appliances of his own invention. By this process, Sulphurets or pyrites, are worked to within an almost unappreciable percentage of a fire assay. Sulphurets have been brought to these works after they have been once worked, (imperfectly, however, as they always will be in unskilful hands,) and afterwards submitted to the most careful and elaborate pan process for amalgamation. The same sulphurets, so treated, have subsequently been submitted to treatment by Mr. D. with a result more remunerative, even, than that first obtained at the mill.

Mr. D. has made this business a subject of much study and experiment, the result of which has been the reduction to practice, on a large scale, of the well known laboratory process of dissolving gold with chlorine gas. Hence the process employed by him is known as the "Chlorine Gas Process," instead of the "Hydrochloric Process," as stated in a previous issue of this paper.

### DESCRIPTION OF THE PROCESS.

The sulphurets when received at the Laboratory are roasted at a red heat on a reverberatory hearth, until they are completely desulphurised, and the arsenic, if any is contained, is pretty effectually driven off. This operation requires from 10 to 24 hours, according to the nature of the material to be operated upon, the ore losing about 30 per cent. of its original weight by the operation. When the roasting is completed, the ore is removed from the hearth to a tank, where it is slightly moistened. After remaining a proper length of time in this condition, it is again removed to a large vat, capable of containing from three to four tons of the roasted sulphurets. This vat is constructed after the manner of a filter, and is filled with the ore to within about six inches of the top. A cover of wood is then placed upon the cistern and carefully luted to render it, as nearly as possible, gas-tight.

The vat, thus prepared and charged with the ore, is now ready for the introduction of the chlorine gas, which is manufactured the usual way, and passes into the vat beneath the ore. The gas soon finds its way into and through every part of the entire mass of ore, and of course, comes in contact with every particle of gold, however fine, which, the desulphurising process of roasting has liberated from its mechanical and chemical connection with the iron, sulphur and arsenic, in their several combinations. By this process every particle of gold thus liberated, is changed into a chloride of gold. When the impregnation is fully completed, the cover of the vat is partially lifted and a stream of water turned upon the top of the ore, covering it to the depth of about six inches. This water immediately commences percolating downward through the mass, dissolving in its

passage, the chlorine of gold, which it takes along to the bottom of the vat, through the filter, and is discharged through any convenient orifice, into a leading trough which deposits the liquid into a number of carboys conveniently arranged for its reception. The gold thus held in solution is then precipitated by sulphate of protoxide of iron. Water is continually being passed through the mass of ore in the vat until the test tube shows that it no longer brings away gold. The test is very simple and will not fail to detect the smallest appreciable quantity of gold, even in a large quantity of water.

The above process is both simple and effectual, and may safely be pronounced the most perfect and simplest mode of extracting gold from sulphurets yet introduced into this State. Persons interested or curious in such matters will be pleased with a visit to, and an examination of these works. Quartz miners will do well to call upon, or otherwise communicate with Mr. Deetken, upon this matter. There are but few mills in the State working auriferous rock, who will not find it to their advantage to have their sulphurets for treatment, under this process. Mr. D. will take pleasure in showing visitors through his works, explaining the *modus operandi*, etc. He will also exhibit, in operation, an approved apparatus for separating the sulphurets from the ore; at the mill, and for a cost of, from \$50 to \$100, will furnish said apparatus and provide experienced parties for setting up the same, at any mill, where the proprietors may be desirous of concentrating their sulphurets. Neither power nor clean water are required to operate it.

Mr. D. is now making arrangements for working silver ores, a full notice of which, will be made as soon as the necessary improvements have been completed. It may be proper, in this connection, to state that the process employed by Mr. D. for extracting gold from its ores is not applicable to silver.

**GREAT SALT MINE.**—It appears from scientific investigations that the salt deposit at New Iberia, Louisiana, is of the most extensive and wonderful description, rivaling, in all probability, both in extent and purity, the famous, though recent discoveries in the Humboldt region. A late account says:—"Imagine, if you can, the granite of Massachusetts, or the marble of Vermont, to be solid deposits of pure rock salt, clean and transparent as so much clear white ice, in one solid, inexhaustible mass, underlying the earth, and you than acquire an imperfect idea of the vastness of this salt formation."

**A GOOD SUMMER'S WORK.**—The La Porte Mountain Messenger of the 18th inst. says that the Campbell brothers of Chandlerville, near La Porte, took out about \$4,000 at their first washing in May; cleaned up again about the first of July, taking out \$9,700; and expect to take out as much more at the close of the season. In addition to this over a thousand dollars was taken out of the sluices in the spring. Altogether, this makes a pretty good summer's work.

**SOLDIERS' VOTE.**—The roll of the soldier's names entitled to vote at the next general election, in this State, has been filed in the office of the Secretary of State. It is two hundred feet long and contains about 8,000 names.

## THE INTERIOR OF THE OPHIR MINE.

The local reporter of the Territorial Enterprise, paid a visit to the Ophir mine, on the 14th inst. ant, one day before the recent extensive "cave." We give the following extracts from his report of that visit:—

We entered the "north mine" through a tunnel in the vicinity of Ophir office, and traversed it through endless drifts and shafts, and climbing down from level to level, on dizzy and uncertain ladders, which seemed to rest on solid darkness. We even saw the "Ophir horse," which has gained such celebrity on the Pacific coast, and we cannot say that we were altogether satisfied with it. \* \* \*

We saw the old Virginia ledge, also, where it is cut in a tunnel, and there is nothing in it—not even quartz. And we saw a very curious thing, in the shape of a broad ledge of red, rotten quartz, running east and west, straight across the Comstock vein! It contains a trace of silver—about twelve dollars to the ton. Here and there, in the countless chambers of the north mine, excellent ore is found, but as a general thing, the lead is not near so rich here as it is further south. We went down to the fifth level, and passed under the Spanish mine, reached the main Ophir south of it. Here, vast quantities of first, second and third class rock are being excavated, day and night. A drift has been started, for the purpose of striking the rich streak of ore recently found in the Spanish mine; it will have to be carried fifty feet further before the object can be accomplished. A weary descent of an apparently bottomless staircase, brought us to the lowest gallery—the sixth. It was sloppy in some places, on account of the stream of water struck in the back ledge, four or five months ago, and which continues to flow in considerable volume. From this depth—313 feet below the surface, Mr. Wilder sunk a shaft a hundred feet deeper, but struck water, and had to abandon it. The Latrobe tunnel, however will drain it before long. The Ophir mine is in superb condition, and under the watchful care of its officers, all its concerns proceed with the smoothness and regularity of a faultless machine.

It may not be out of place in taking this "inside view" of the Ophir on the 14th., to take a review of the same ground as it appeared the day after

### THE LATE CAVE.

At half past 10 o'clock, on the morning of the 15th inst., 50 feet, in length, of the Mexican mine, from top to bottom, (215 feet,) caved in—that is, the opening, made by drifting out the vein was closed up by the top wall falling in upon the bottom wall, of course, crushing down the timbers. A small portion of the Ophir, adjoining the Spanish—50 feet of the fourth gallery—also caved with the latter. The lower gallery of the Ophir, as we understand it, is still in good order, and persons can pass from the northern to the southern Ophir, directly under the entire cave in both mines.

The Mexican Company will be obliged to sink a new shaft through which to work their mine, while the Ophir will not be inconvenienced beyond the necessity of cleaning out a little rubbish, which will occupy a small portion of their force five or six days.

The cave, it is said, had been expected for several days, and might have been avoided by filling up a portion of the open space with rubbish, which would then have acted as a pillar, of large extent, and been an ample and permanent support for any weight that could have come upon it. The two extensive caves, which now have occurred on the Comstock ledge, the first, some months since in Gold Hill, and the second one in the Mexican mine, should operate as a caution for properly securing the extensive workings which are now being opened in that region. Large caves, like the two alluded to, can always be avoided by a mere modicum of forethought and precaution.

## MINING CORRESPONDENCE.

NOTES OF A TRIP TO SLATE RANGE via LOS ANGELES AND EL PASO.—No. 7.

MESQUIT SPRINGS, JULY 1, 1863.

Mr. A. McPherson, of the Slate Range Mill Co., formerly at 426 Davis Street, in your city, spent a portion of last Friday with me, on his way to San Francisco. I learn from him that the mill is now in complete running order, but water is so scarce they cannot make full time, until they receive and lay down the pipes to bring in the water from another spring near by.

## ANOTHER IMPORTANT DEVELOPMENT.

This company has fully demonstrated the fact, that the grease-wood, which is abundant every where on the desert, is a first rate material for making steam. This fuel produces such an intense heat, that steam can be raised and the entire machinery of the mill started in fifteen minutes! Steam can be easily kept up by the labor of one man employed to break up and shovel in this fuel.

The importance of the discovery, to this region, can scarcely be estimated. Up to the time of making the above experiment, all calculation for steam power had been based upon the supposed necessity of contracts of from \$35 to \$40 a day for wood to be hauled a distance of some sixty-five miles. Failing to find any one to take a contract even at such terms, the Company, as a temporary alternative, took their own team and went to work hauling in the grease wood with the above result. The total expense will not exceed \$25 per day.

## SALES OF FEET.

The first sales of mining ground in El Paso District, was made on the 28th of May last, at the office of C. W. Tappan, Mesquit Springs. 1240 feet on eight different lodes, changed hands for the sum of \$1,000. All concur in the opinion, that \$5,000 would have been a nearer approximation to their value; but the young man who sold, had his mind set on a connubial engagement, which was to be consummated about the 4th of July, and was determined on selling. Since that transaction, several other sales have been affected, at at prices ranging from 50 cts. to \$6 per foot.

I intend to give in this paper some data in regards to labor to be expended in opening these mines, that I judge will be interesting to working men of small means. We all realize the importance of labor in developing our claims, and feeling our helplessness, for want of means and strength, we are willing to divide with those who feel disposed to furnish those means and help. Holders of the best claims in the district, now offer one half they hold to parties who will sink shafts on them so as to determine whether they will pay to expend further labor on them. Messrs. Keller & Banning, capitalists of Los Angeles, have taken from fifteen to twenty leads in that way, and have opened some of them, but have suspended operation from different causes. First, they had about twenty-five Mexicans, at about \$25 per month and found, and three or four Americans. The Mexicans soon became disgusted with the excessive labor under the burning sun, at climbing from five to eight miles to their work every morning, and the small pay.

The Americans were affected in a similar manner, and went to prospecting, finding that they could make more in a day at that, than they could in months in the tunnels. The manager, Capt. Moore, has gone down to Los Angeles to make a new start. They will make a rich thing of it, if they go on; provided always, the lodes are valuable, and if they are not, a great many experienced miners are most egregiously sold.

I wish the fact promulgated, that these opportunities are open for working men who can raise sufficient means to bring mining tools, provisions and strong muscles into the district, say in August or September. Say three units, with \$100 each, buy provisions and tools for three months, as per memorandum, in my last letter. The cost will not exceed \$15 each, to Los Angeles, besides freight. Then they can put their freight on a wagon, at five or six cents a pound, and walk out as we did, living on our own provisions, and thus, less than \$20 dollars will land them here. When they arrive, they can look at the mines and go to work, or they can prospect for awhile and see which will pay them the best.

There is a party, talking about putting up quartz machinery

on a water power at Tahachapa, and another is talking of putting one up here. We have millions of acres of greasewood, with which the Slate Range Mill Co. are so pleased. We have also plenty of water, and at Grape Vine Springs, eight miles South, there is a sufficiency for six mills, with an abundance of fall.

Mesquit Springs is nearly the centre of the district; while Laurel Hill, fifteen miles North, at the northern extremity of the district, may have the richest lodes, but fuel and water are scarce.

I have sent to Laurel Hill for specimens from the leads which have been opened there, to forward to you, and hope to get them soon.

There is a splendid water-power at Oak Creek, forty-five miles South, for half-a-dozen mills, and plenty of fine timber.

July 5th.—Yesterday morning I started by moon-light, at four o'clock in the morning, and walked to Laurel Hill. I applied for specimens, but the miners hesitated to furnish them, as they preferred to wait till they go down on the leads. They are now doing only the days work required on each claim to hold them. I succeeded, however, in securing a few, which with others from this district, I will send you by first conveyance.

C. W. T.

In connection with the above letter, we compile the following from a letter from an occasional correspondent of the *Bulletin*, of this city, and published in that paper on Wednesday, last:

## EL PASO DISTRICT.

Late assays of ore from El Paso District gives as follows: Of the Ophir, \$1,155 per ton of silver; Laurel, \$200 silver and \$76 gold; Newport and La Plata, \$370 silver; Montville, \$175 silver. Various other leads in this district give about the same as the Newport.

## SLATE RANGE DISTRICT.

In the Slate Range district, the Antrim has assayed all the way from \$500 to \$3,000 silver. Several tons of ore from this lead have been shipped to San Francisco, which paid big. Of the Kenebeck, which is near the Antrim, no assays, I believe, have been made very lately—at least no returns have been received here. Those made, some time since, gave \$300 in silver per ton. The croppings of this lead are said to be 60 feet wide. The Rockland lead gave, from a select specimen, \$2,700 silver per ton. The Albany, owned by Seales & Co., who have a mill on the ground, is paying well—gold. The Knoxville has hundreds of tons of ore on the surface that will pay \$200 to \$400 gold. The Portland—silver lead—promises well. The Comet, a spur of the Kenebeck, and the Robert Emmet, both yield excellent rock, and are thought to be rich.

## THE COLORADO RIVER MINES.

At El Dorado Cañon, on the Colorado river, the principal lead is the Teschalticup, which, as I wrote you long ago averaged from five assays over \$2,900 per ton, as they get down on the lead. The Monitor, in the same district, assays from \$700 to \$1,200 silver. There are other leads in the cañon equally rich with the Monitor, but I cannot give the figures. The Rock Springs district and the Chimawayo district, further down the river, have demonstrated to contain rich leads; definite results I have not at hand. The Apache Chief Copper lead, still further down, near La Paz, is exceedingly rich, assaying, I understand, 85 per cent. of copper and \$105 of silver to the ton. It has been opened up, and the ore is to be shipped to San Francisco. It is about 30 miles from the river—beyond. The Salizar and the Scotty leads, near La Paz, are also rich.

## OTHER MINING DISTRICTS.

The copper mines of San Antonio, just over the line in Lower California, are very valuable, as they are near water transportation, being only 7 miles from Enciendita Bay. They assay 34 per cent., and 20 per cent. ores, it is said, will pay. The owners already have nearly 100 tons ready for shipment. I believe a schooner is now on the way down there for a cargo of the ore to take to San Francisco.

ACCOUNTED FOR.—It has been noticed that the number of marriageable young women coming overland, this year, is much smaller, in proportion, than heretofore. The Editor of the *Humboldt Register*, accounts for the circumstance from the fact that the young ladies accompanying the emigrant trains, are so weary and foot sore, when they arrive at Humboldt, that they readily assent to the intreaties of the Benedict miners in that out side settlement, to remain and become wives!

TREASURE EXPORT.—The excess of treasure shipments, this year over last, up to July 20th, was \$4,939,678.

AN EXPENSIVE BUILDING.—The new Metropolitan hotel, in this city will cost, furnished, \$300,000.

USEFUL AND CONVENIENT.—H. H. Bancroft & Co. have laid upon our table a new publication, very useful and convenient to miners and others in this State. The work has been compiled by H. B. Congdon, Esq., and is put up in a neat duodecimo form of 90 pages. The compilers preface which we append, is fully descriptive of the plan and object of the publication:

"The present volume contains all the laws and decisions which relate to Mining Corporations in the State of California; also the necessary forms used in the incorporation of Mining Companies. It is published because of the great necessity of such a work. Many thousands of men in California and Nevada Territory are directly engaged in mining and thousands more are owners of mining stocks; many millions of capital are invested in them and nearly the whole business of California and Nevada Territory is based on mining interests, yet comparatively few persons know any thing definite about the laws which govern these great interests. These laws are simple and easily understood.

The professional man will find the present volume of great convenience, as all the mining laws are compiled in their proper order, and the decisions of the Supreme Court bearing on the subject are arranged under appropriate heads. The most approved forms used in the formation of companies and a full and complete index are appended, and there will be no occasion for looking beyond the present volume for any law, decision, or form which relates to the subject.

To the great number of individuals who are members of incorporated Mining Companies and owners of mining stock as well as those who may become interested in like companies this little compilation presents an opportunity of acquiring perfect knowledge of the laws which govern the subject of their interests.

To persons who may desire to form Mining Companies it gives complete instruction and will enable them to commence and perfect their organization without legal advice or assistance."

CHINESE MECHANICAL SKILL.—The skill of the Chinese in many of the mechanical arts, is wonderful. We are assured by a gentleman of this city, who has had extensive opportunities to observe that singular people, in their shops and homes, in the familiar and confiding relation of a religious teacher, that the accounts we read of them in this particular, are not at all exaggerated. As an instance of their skill in one important branch of industry we have before us, this present writing, the account of a meeting of the Manchester (England) Philosophical Society, something over a year since, at which, Mr. Fairbairn, the President, exhibited two large pans of cast iron, made in China, which were used there for boiling rice. The metal, at the strongest pressure was only one-tenth of an inch in thickness, and possessed considerable malleability. The President remarked that the art of making such large castings, so thin and perfect, was unknown in England.

AN IMPROVED DRILLING MACHINE.—Mr. J. S. French, of this city, says the Bangor (Maine) *Whig*, who has been in California for some years, and is now on a visit home, has invented a machine by which the common hand drill worked by one man with three or four times the rapidity of execution obtained by the old sledge striking operation. We saw one of his machines, (manufactured by Messrs. Hinckley & Egery,) at work yesterday. By turning the balance-wheel of two feet in diameter, which is done with ease, the drill is struck by a twenty-five pound sledge, from sixty to ninety times a minute, and penetrates the hardest granite as fast as four men will do it by the ordinary process. The machine is intended for quartz-mining operations, where horizontal tunnels are to be carried into the bowels of the gold bearing hills, and it can easily be arranged so as to drill in all directions. It appears to be an important labor saving invention.

RICH QUARTZ LEDGE.—The Nevada *Journal*, of a late date says: A rich quartz ledge, situated near Omega, from which some picked rock, pounded in a mortar, has yielded at the rate of \$5,000 per ton. A mill to cost about \$7,000 has been contracted for, to be put up immediately. It is supposed about 1½ tons of the richest rock will pay for some of the most prominent men in this city are engaged in, and are owners of it. The company was incorporated July 11th as the Tecumseh Ledge Co. We have seen some specimens which appear exceedingly rich.

DANGEROUS CHARACTER OF BLACK PETROLEUM.—The *City Register*, in alluding to the recent fire, states that petroleum, in bulk, is very dangerous after being recently agitated. Any movement of a large quantity brings up the benzol, which is the lightest quality of it, to the top, and into the atmosphere. This is an inflammable gas. The slightest contact with a flame sets it off in a flash. Bulk oil imprudently contacts the atmosphere, and on the contact of a flame of any kind it ignites and explodes.

AN INTERESTING DISCOVERY.—An ancient copper pit, has recently been opened at the Portage Mines, Lake Superior, which, in some respects, is the most remarkable relic of an unknown race of miners, who worked the copper lodes of that region centuries ago. The Lake Superior *Mining Gazette* says :

The ancient miners have worked down on the hanging wall side about ten feet below the surface of the rock, where further progress was prevented by an almost continuous floor of copper. The copper in this floor is exceedingly pure and massive; and most singular of all, many of the lately exposed faces bear evidence of having been cut with some small sharp instrument.—These marks are distinctly visible in several places, the marks and impressions being as clear and sharp as if made within the past year. This, we believe, is the first instance where it was apparent that any of the ancient miners had tools of sufficient hardness to take out copper, even after being considerably softened by the action of fire. It is quite evident that, as in almost every old pit which has been opened in the country, fire has been the agent used to soften the metal before it was cut off, as the rocks bear evidence of calcination. Several stone hammers have also been taken out of the waste rock and earth, which has been piled in the pit, and pieces of birch bark and burnt wood have been found mixed. As yet the pit is only partly cleaned out, and we may expect to see other curiosities and peculiarities when the debris is all removed. Another interesting feature is the fact that the bottom of the trench is nearly one continuous bed of copper.

MINERAL DISCOVERY IN MARIN COUNTY.—We have before us a sample of ore, obtained from Marin County, which, according to an analysis by Mr. J. H. Churchill, of this city, contains :

Sesquioxide of Chromium.....	42.0
Oxides of Iron.....	40.5
Alumina.....	15.0
Silica.....	2.5
	<hr/> 100.0

This ore will probably be very valuable when San Francisco chemical manufactures are further developed.

Candles, wax and green backs, dyeing and bleaching will each lay it under contribution.

THE TEMESCAL TIN MINES, situated in the mountain range 60 miles east of Los Angeles, are probably the richest mines of that metal, in the world, and would probably have been in active working condition long ago, had it not have been for a dispute between contesting claimants with regard to title. The case is now pending in the Southern District Court of the United States, for California. It has already been argued, and the decision of the Court will soon be rendered. We may look with much confidence, for early and important developments from the "California Tin Mines" after the decision, above referred to, has been duly rendered.

## THE MINERS' LABORATORY.—NO. XI.

## SILVER.

Silver is the whitest of all metals, and is capable of receiving a lustre inferior only to polished steel. It is exceedingly malleable, and in ductility is next to gold. It is harder than either tin or gold, but less so than copper. When pure it may be easily cut with a knife, and in that state melts at a full red heat. When fused in an open vessel, it absorbs oxygen in large quantities, sometimes amounting to over twenty times the volume of the metal itself. On cooling to the degree of solidity, the oxygen is entirely expelled.

When silver is heated to redness, in contact with porcelain or glass, the absorbed oxygen combines with the metal to form an oxyd, which, uniting with the silicic acid of the substance with which it is in contact, gives rise to the formation of a yellow enamel. When heated very strongly in a blast furnace, it gives off sensible metallic vapors. By fusing a large quantity of silver, and afterwards allowing it to cool very gradually, cubic and octahedral crystals may, on piercing the solidified crust and running off the still liquid metal, be obtained. Silver does not absorb oxygen at ordinary temperatures, but speedily becomes blackened on exposure to an atmosphere containing the most minute traces of sulphureted hydrogen gas, which is decomposed by it with the greatest facility.

Heated to redness, in contact with the caustic alkalis, it does not become in the least affected, and is for this reason frequently employed for making crucibles to be used when attacking various substances by caustic potash. In the presence, however, of fused alkaline silicates, silver vessels become acted on, and the silicate is stained of a yellow color. Oxyd of silver is reduced by heat alone, and a globule of metal is thus obtained.

Unless in a state of extreme division, silver is not attacked by hydrochloric acid, and even then requires to be heated to the temperature of ebullition, before the decomposition of the acid is affected. By dilute sulphuric acid no effect is produced, but when strong sulphuric acid is employed, it is, when aided by heat, readily decomposed, with the formation of sulphate of silver and the evolution of sulphurous acid gas. Nitric acid readily attacks silver even at ordinary temperatures; binoyd of nitrogen is evolved, and nitrate of silver is produced. By chlorine, iodine and bromine, silver is, even in the cold, readily attacked.

Silver is found not only in a pure or *native* state, but in a great variety of combinations with other metals and substances, forming no less than twenty-three distinct species, already recognized and described by mineralogists and chemists. We shall attempt to describe these various minerals, and their action under the simplest tests, that those not versed in the science of mineralogy can hardly fail to distinguish one species from another, and to ascertain to what species any silver mineral they may find should properly be referred. It is important to observe, however, that the simple silver minerals, as with those of other metals, generally occur in the veins in mixtures among themselves and other mineral species, so that it is not always possible to so separate them that each may be recognized by its peculiar characteristics. It is only here and there, generally, that specimens with the characters well-marked and distinct, can be found.

In the upper portions of mineral veins, where the air and moisture has had access for ages, a certain amount of decomposition has taken place among the minerals, and new combinations have been formed, which may be termed *secondary ores*. These are general more earthy, and highly colored than those in the deeper parts of the vein, being more intermingled with salts of copper and lead, and peroxyd of iron. Such ores, in Mexico, are generally known as *colorados*, especially if red, and in Peru as *pacos*. The ores from a greater depth in the mine which have not been affected by the access of air are more brilliant and black and are called *negros*.

If the gangue or vein-stone is of quartz, as, for example, in the Comstock vein, Washoe, this remains a porous mass, or "ledge," and is more or less free from valuable minerals at the surface, being a mere skeleton of the vein, and valuable chiefly as an indication of riches below. With ores of the precious metals, the cavities of outcrops of this character generally contain more or less of the metals in fine grains or dust, which may be collected by panning, as is well known in the case of gold quartz.

Many of the simple minerals of silver are very seldom met with, and are not of economical importance. Accordingly, a division has been made, and the most important ores will be first described. Of this class, the most common mineralizing elements are sulphur and antimony. Chlorine and bromine also form important compounds, which formerly were only known as mineralogical curiosities, but have since been found to be abundant in some of the Mexican and South American mines. It is possible therefore that some of the compounds now so rare, may hereafter be found among the most important and productive ores.

## THE MINES OF LOWER CALIFORNIA—SAN ANTONIO DISTRICT.

The above mines are located near the Eastern Coast of the Peninsula of Lower California, and about one hundred miles north of Cape St. Lucas, and are not over twenty distant from good anchorage, in Ventura Bay, to which a good road has been constructed, and is now in use. The mines of this district were the first ever worked in the Territory of Lower California. The existence of the precious metals in these mountains, had been known to the early Mexicans long previous to the middle of the last century, but it was only at about that time that any attention was paid to working them. The missionaries had previously discouraged any attempts of the kind, as likely to introduce trouble and disorder into the country.

About the year 1750, Don Manuel Ozio, a man who had acquired much wealth in the Pearl Fisheries on the coast, commenced extensive mining operations in this district, by which he added largely to his fortune. About this time, a Castilian, named Marone, also discovered and opened the mine now known at the "La Marronena," being named from its discoverer. The two gentlemen above named, were considered the wealthiest men in that part of Mexico. The first named paid \$36,000 in one year as the Government's one-fifth share of the returns of his pearl fisheries. This money was paid in "ores" extracted from his mines.

It is said that Marone joined the Mexican Government, during a space of two years \$1,000,000, all of which was taken, during that time, from his "La Marronena" mine. There are now some twenty mines, being opened by San Francisco capital, in a portion of this district comprised within a circuit of less than fifteen miles, aside from them fully three times that number are held by Mexicans. This district is fully equal in value of its mineral wealth, to any similar district in the world, not excepting even that traversed by the famous Comstock vein in Washoe. The range of mountains intersecting this district runs nearly North and South, their northern direction being a little to the East. This mountain range is traversed by three distinct leading veins of highly metalliferous ore, running nearly parallel, and some two miles apart. Upon these several veins, are located the claims alluded to, each full claim comprising 2,600 feet, and subdivided, by Mexican custom, into twenty-four shares or parts.

The middle vein appears upon the surface as three distinct leads, which, in all probability, unite at no very considerable depth. The most important locations upon this vein, commencing on the North, are the San Nicolas, San Pedro, La Fortuna, La Codicia, Pena, La Solidad, La Marronena, La Mina, Me. docina and Molina. The two first mentioned, the sixth, and the last belong to a company of wealthy Mexicans, residing chiefly in the City of Mexico. This is probably the most wealthy and extensive mining company in the world. In addition to the four mines already named, belonging to this company, they also own eighteen other mines in other localities, but all located on the Peninsula of Lower California. This latter fact, is rather significant of the high estimation in which this portion of Mexico is held, as a mining region by the capitalists of that country. The six mines, above enumerated, as not belonging to the Mexican Company, are under the control of San Francisco capital, and are all being vigorously worked.

We have before us the first report of the Superintendent, R. C. Jacobs, Esq., of the Pena and Marrionena mines, from which we learn that most gratifying progress is being made upon both of those mines. About 100 cargoes of very rich ore have been taken out of the latter, besides thoroughly cleaning out the old workings, putting down a new shaft, erecting houses, etc., and making all necessary preparations for active winter operations. The Superintendent, who is

now in this city, brought up with him thirty sacks of ore, which is to be worked here, as a trial lot. This ore may be seen at the office of the Secretary, Wm. Faulkner, Esq., No. 411, Clay Street. No ore has yet been received from the Pena. The preparatory labor, however, for getting out ore is nearly complete.

The first of the *re-locations* in this district were made, about four years since, by the large Mexican Company, already alluded to. The greater number, however, were made last Summer and Fall. The early workers of these mines, abandoned them during a revolutionary period that occurred many years ago, the precise date of which, we have not now at hand.

We shall resume this subject in our next issue, giving some account of the ancient manner of working these mines, peculiar characteristics of the veins, country, etc.

## THE COPPER EXCITEMENT.

Evidence, corroborative of our recent remarks in reference to the existence of undue excitement with regard to copper, is already beginning to reach us. We copy the following significant paragraph from the Grass Valley *National* of the 23d. instant:—

The fever for prospecting has abated, and instead of the extravagancies in which our people indulged a short time since, as to accumulating fortunes in a few weeks time, copper and other interests are properly viewed, and men no longer become enthusiastic over the discovery of auriferous or verdigris, nor do they take such indications as indubitable evidences that a Union or a Napoleon copper mine is near the surface, to render them fabulous rewards for a few days' labor. All the prospecting excitements of this country have had their reactions, generally disastrous in their character, but that of the present is full of healthful signs. As we predicted last Spring, a majority of the reported copper discoveries hereabout have proved themselves worthless, but this prospecting developed numerous rich copper fields, and from many of the claims but recently opened fine qualities of copperiferous ores are now being shipped. The amount of prospecting here is at present less than it has been for the past six months; while more substantial work, with better labor-rewards, is being performed than at any time during our residence in Nevada county.

**COSO MINES.**—News of late date from the Josefine Mine report another rich strike, with strong evidence that it will continue so.

The Mayflower, at a depth of thirty-five feet, is taking out rich rock, and have three tons at the Lotta Mills, awaiting its turn to be crushed. An assay, said to have been made on average rock, taken from this claim, by Messrs. Kellogg, Houston & Co., gives \$1,557 in gold and \$26 in silver. This lead is situated one mile from the Lotta Mills, and contains 1,200 feet.

**RICHER THAN EVER.**—The *National*, published at Grass Valley, says that the Allison Rauch Company has recently struck rock much richer than any hitherto found in that famously rich lode. The discovery was made at the bottom of their 400-foot incline. The *National* says it will be crushed in a few days, and predicts that it will astonish even those familiar with that immensely rich mine.

**LARGE YIELD.**—According to the Territorial *Enterprise*, the Ophir Company took out, within a fraction, \$200,000 during the month of June. This would be equivalent to about \$142 per foot. The above yield would indicate an early advance in the per centage of dividends of this company.

DIVERS have already succeeded in securing \$50,000 worth of goods, and raised one box containing \$31000 in specie from the wreck of the Anglo-Saxon, off the coast of Nova Scotia. They also brought up one hundred and sixty dead bodies, and caused them to be buried on shore.

**THE BUSINESS OF A SCHOLAR.**—To talk in private, to think in solitude, to inquire or answer inquiries, is business of a scholar. He wanders about the world without pomp or terror; and is neither known nor valued but by men like himself.

**LARGE LUMP.**—A nugget weighing 15¾ pounds has been picked up near Columbia, in Tuolumne county.

## THE MINING SHARE MARKET.

The activity in the Mining Share Market, for the past week, has been quite equal to any similar preceeding period. The transactions embrace a large number of stocks, though chiefly confined to those that are paying dividends or rapidly approaching that point.

Gould & Curry shares have not been dealt in. Holders are demanding \$5,600 with buyers at \$5,500. A dividend of \$1.00 per foot was declared on Saturday.

Ophir has been largely dealt in at fluctuating rates. These shares opened at \$2100, advanced to \$2,300, but declined to \$2,000 in consequence of sale of July dividend at \$30 and \$20 per foot.

Savage remains at about the last quotations. Efforts are being made to secure mill facilities for working the ore. Until that end is accomplished, and dividends placed in early prospect, but little will be done in this stock.

Chollar still continues to advance, and is quite in favor, but with limited transactions.

Daney shares have been quite active, but at declining rates. The market opened at \$310, stimulated by recent advices of favorable indications in the company's main tunnel. Shares subsequently declined to \$240, upon rumours of a low dividend for the coming month. Dividends on 500 shares for August have been sold for \$7 dollars per foot—last dividend \$14. 820 shares of this stock has changed hands during the week.

Potosi is enquired for at \$740—lowest offer, \$740.

North Potosi has been quite active at slightly declining rates.

Burnside has been largely dealt in at \$11 @ \$13. 432 shares have changed hands.

Buckeye which was a favorite speculative stock, last week, and largely dealt in, has been more quiet the past six days, and is quoted at a slight decline—the sales having been 222 shares at \$45 @ \$53.

Blue Ledge, El Dorado County, is being considerably enquired for. Sales of 350 shares are reported at \$10½ @ \$11.

Sierra Nevada has a market at \$65; Burning Moscow at \$120. Charles Canyon is quoted at \$70 @ \$80; Lady Bryan is enquired for at \$13; Mount Davidson at \$3; Sacramento at \$50. Melones \$115 @ \$125; Fellowes \$65.

El Dorado shares have been in request at \$70 @ \$86; Madison is in demand at \$25; Governor Nye at \$10. Pride of the West may be quoted at \$100; Overman opened at \$390, declined to \$365; Crown Point shares have reached \$1225; Imperial is quoted at \$150; Bullion at \$80.

ESMERALDA.—Wide West has buyers at 145; Silver Hill, \$35; Utah, \$65; Josephine, \$11; Coso, 20; Pond, \$27½; Willow Springs, \$3.

HUMBOLDT AND REESE RIVER.—Sheba, 26 feet sold for \$300; De Soto is enquired for at \$75; Poney \$10; Buckeye is offered at \$20; St. Charles is enquired for at \$4; Constitution, 15 feet changed hands at \$15 per foot; Exchange, sales of feet reported at \$50 @ \$56; Humboldt Tunnel, 120 shares sold at \$1½ @ \$2; American Basin, \$15 asked; Pine Nut, \$10 asked.

## COPPER.

There is an evident lull, at the present time, in the Copper excitement, throughout the State. This quietude, however, is indicative of an approaching healthful condition of that branch of industry. It is a rest from an undue and frenzied attack of Copper-mania, which will undoubtedly result in much good by awakening prospectors to the necessity of a proper development of their mines, rather than rushing to capitalists with a few surface indications, to sell "feet" at big prices. Our people are beginning to learn that every surface indication, does not lead to a well founded and paying vein of copper. Such indications, however, are true starting points, which, as a general thing, may soon be developed into paying veins, or prove worthless to follow.

The results of legitimate explorations have already satisfied capitalists that the State is rich in copper, and no doubt need now exist, but that California will soon take rank as the first copper producing country on the globe. It is not necessary, to this end, that every copper mine should become a Union or a Napoleon; neither should our miners set down and take it for granted that there are no more such mines of

copper to be found. Let them continue their explorations in an energetic and legitimate manner. The chances of success in copper, in this State, are undoubtedly greater than those in any other metal.

The Union is making daily shipments of ore. \$2,000 per foot is asked for the only stock in the market.

Newton is progressing slowly, with no stock in the market.

Copper Hill is improving, and is now held at \$10 per share. Taking out about two tons of ore per day.

The Napoleon is progressing finely. A third level is now being run at a depth of 165 feet. The vein at that depth is 14 feet. Upwards of 100 tons of ore have been shipped to this city within three weeks.

The Keystone is also shipping ore and being efficiently worked.

Reports from Carmen Island, are that a large and true vein of ore has been struck.

There are six Copper mining districts in Butte county. The Forest lode, in the Kentucky Ranch District, it is said, yields ore containing 60 per cent. of metal. The lode is three feet wide.

In Calaveras county, work is rapidly progressing on the Empire, Calaveras, Lancha Plana, Josephine, Camp & McNulty, Collier & Hughes.

## P. M. S. CO.

PACIFIC MAIL STEAMSHIP COMPANY'S line to PANAMA, connecting via the Panama Railroad with the steamers of the Atlantic and Pacific Steamship Company at Aspinwall.

## FOR PANAMA.

The following Steamships will be dispatched in the month of May, 1863.

July 3d, - - - - - Steamer Golden Age  
July 13th, - - - - - Steamer St. Louis  
July 23d, - - - - - Steamer Constitution

Will leave Folsom Street Wharf, with Passengers and Treasure, for Panama

AT 9 O'CLOCK, A. M., PUNCTUALLY,

And connect, via Panama Railroad, at Aspinwall, with steamships for New York.

For Freight or passage, apply to

A. B. FORBES, Agent.

je4 Corner of Sacramento and Leidesdorff sts.

## WHEELER'S

## Amalgamating and Separating Pans.

It is acknowledged by all who have examined the principles and tested the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of trituration, and in cleaning up. By the introduction of the Separating Pan to follow the trituration this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

\* These Pans may be seen in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves.

sol6-1f

ZENAS WHEELER.

## Wm. P. TAAFFEE,

IMPORTER AND JOBBER OF

\*Staple and Fancy Dry Goods,  
CARPETS, DUCK, ETC.,

Manufacturer of

WARRANTED FIRE-PROOF SAFES  
Mill Work, of all kinds made to order. All kinds of Repairing done at moderate prices. je13

## REMOVAL.

OFFICE OF THE PACIFIC METAL  
Original Office is removed to 509 Sacramento street. Having enlarged our Works at North Beach, we are now enabled to reduce from 10 to 15 tons of Silver or Gold-ore per day.

Gold and Silver ore, and Sulphuret Assayers', or Silversmiths' sweepings reduced or purchased.  
\* COPPER ORES—highest market rates advanced in cash, for shipments. S. C. BRADSHAW, Agent,  
509 Sacramento street, near Sansome.

## SOUTH PARK

Quartz Mill and Reduction Works,

GOLD AND SILVER ORES WORKED AT REASONABLE rates, and Working Assays made of small lots. All kinds of ores crushed at short notice.

J. H. SMITH & CO,  
Office in Shiel's Block, opposite Masonic Temple.  
je13 S. F. CLOUSER, Secretary.

WILLIAM BRODIE & CO.,  
CALIFORNIA FOUNDRY,  
Fremont Street, near Market, San Francisco.

## Light and Heavy Castings,

Of Every Description, Made to Order. Particular attention paid to all kinds of House Work, Plain and Ornamental. jyl3

THE  
BRYAN BATTERY.

The vast interest involved in the reduction of ores on this coast, renders it of the highest importance that the Machinery employed for this purpose should be of the most Effective, Economical and Durable Character. It may be safely said that Millions of Dollars have already been expended upon the various experiments in this class of Machinery, and it is a fact well known to all who have had any practical experience in the matter, that every new process developed during the past twelve years, has been set down as a failure. The Ordinary Stamp Battery

## ALONE STANDING THE TEST.

This, with the Improvements which Experience has suggested, is now regarded, by common consent, as the only reliable

## METHOD OF CRUSHING ORE.

THE BRYAN BATTERY, as now constructed, is believed to combine all the improvements which the experience of the past has afforded. They have been

## EXCLUSIVELY ADOPTED

by many of the most prominent Mining Companies in the country, and have been, for the three last years, subjected to the most severe of all tests—that of constant use—and in every case have been pronounced

## EFFECTIVE, SUBSTANTIAL AND RELIABLE.

They are now extensively used throughout the mineral regions of California, Nevada and Mexico, and have established a claim to public confidence, never yet equalled in any piece of mining machinery.

These Mills are constructed almost entirely of Iron, and, consequently, are not affected by the intense heat and dryness of atmosphere, common to all mining localities. They are adapted to

## BOTH WET AND DRY CRUSHING,

and are warranted to reduce, with the same weight of Stamps, 25 per cent. more rock than any other mill in use. Each Battery is complete in itself, and forms a perfect mill—while any number of them can be added at a subsequent time—thus preserving the symmetry and uniformity of the Mill

As an evidence of the increasing favor with which these mills are regarded, we would mention that the Celebrated Ophir Company first introduced them into their works in 1850, and have been adding a number of Batteries, each subsequent year, until they now have Nineteen, running Seventy-six Stamps.

They are perfectly fitted and set up at our Works, before shipping, each piece being marked and numbered, so that they can be put up and set at work in ten hours after arriving on the ground. They are made of two sizes, four and five Stamps each. The Four Stamp Battery weighing complete about 6,000 pounds, and the Five Stamp about 7,000. The Mortar Rod being cast in sections, when desired, so that the mills can be packed over any mountain road.

We annex the names of a few well known Companies who have adopted them—running from four to seventy-five stamps each—to whom reference is made:

Ophir Mining Co., Washoe Valley,  
San Marcial Co., Mexico.  
John D. Winters & Co., Esmeralda,  
Crown Point Co., Gold Hill.  
Potosi Mining Co., Virginia City,  
Tajo Mining Co., Mexico.  
Sheba Mining Co., Humboldt.  
Lotta Mills Co., Coso.  
American & Mexican Co., Mexico.  
San Carlos Mining Co., Owen's River,  
Union Quartz Co., Aurora,  
Triunfo Mining Co., Mexico,  
Napa Quartz Co., Aurora,  
Petaluma Quartz Co., Gold Hill,  
Francis Mellus & Co., Slate Range,  
W. R. Churchill & Co., Mexico,  
Willow Springs Co., Coso,  
Hews, Howe & Co., Rich Gulch Flat,  
F. A. Benjamin & Co., Mexico,  
O. J. Parker & Co., Nicaragua,  
Gibbons & Clayton, Esmeralda,  
Smith & Clouser, S. F. Reduction Works.  
Amagoza Mining Co., San Bernardino.

AMBIOTYPES in all Styles and Prices.

OLD PICTURES copied with care and accuracy, in any style desired. Particular attention paid to pictures of Children.

Pictures painted in Oil or Water Colors, and retouched in India Ink by a competent artist.

je22

R. H. CORNELL.

## BAUNCHEIDTISM,

THE PRESERVER AND PRODUCER OF LIFE.

THE EFFECT OF BAUNCHEIDTISM AS A METHOD OF curing disease, is a "fait accompli" in medicine, and needs no more proof. The public has crowned Bauncheidtism already with an extraordinary patronage, and it is acknowledged by all men of science that Bauncheidtism is founded on a rational, scientific basis.

It can safely, and with sure success be applied to paralysis in consequence of apoplexy, Podagra and Rheumatism of every description, which kind of complaints can find their only relief by the above method.

Especially can it be applied successfully, in the spring of the year to diseases of the eye.  
Dr. Borchers is the only doctor in California who has the original series of Dr. BAUNCHEIDT and his original oil. Dr. Borchers is also in possession of original letters of the inventor of the method by which he can prove that he is perfect master of the latter.

DR. J. C. BORCHERS.

No. 19 Kearney street, and No. 4, Mark's Place, First story, No. 5. Office hours from 9 to 11 A. M., and 1 to 4, and 7 to 9 P. M. je21

## REYNOLDS'

Patent Cut-Off and Governor,  
FOR STEAM ENGINES.

127 of these Invaluable Machines,

## ARE NOW IN USE

In California and Nevada Territory, giving a perfectly regular motion, and Saving 20 to 65 per cent of the Fuel.

## Steen's Improved Governor

Is the CHEAPEST, SIMPLEST and QUICKEST to act and least liable to get out of order of any Governor in use. It can be seen in operation at the Golden State Iron Works, and at the Stone Breaker, foot of Market Street, San Francisco.

## Clark's Steam and Fire Regulator,

For controlling the Draft or Blast by opening the Chimney or Valve in the Blast Pipe by the pressure of the steam in the boiler. It will regulate the pressure to a pound, on the square inch. It cannot get out of order and any person can put one up in an hour after the damper is put in.

## Ingersoll's Patent Drill Press,

With which drilling can be done the same as with the common ratchet, and when small holes are wanted, it can be done four times as fast. The handle can be worked in any direction.

## Felt for Steam Boilers, Pipes, Etc.

At the lowest market rates.

## Steam Engines, Boilers, Pipes,

Hydraulic Presses, Shafting, Pulleys, Etc., at the lowest market rates.

## Anti Incrustation Powder,

A Sure Remedy for Scale in Steam Boilers, without injury to the iron. In use for the past EIGHT years. Refer to—Sugar Refinery, San Francisco, Cottell & Co., San Jose, L. A. Booth, Esq., Virginia City, and 2,000 others in the United States.

E. T. STEEN AGENT.

No. 33 Fremont Street, San Francisco.

## MINING &amp; SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

THIRD YEAR! VOLUME VI.—NEW SERIES

A new volume of this extensively circulated paper commenced Sept. 11, 1862. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

## The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to Mining purposes, and of everything generally that may be of service to the Miner.

## The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietors having had great experience as Patent Agents, together with facilities at Washington that enable them to take Patent with dispatch.

## The Mechanic and Manufacturer!

Will be greatly benefited by its personal, as its columns will from time to time contain original engravings of new machines and inventions, together with large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

## To Chemists, Architects and Millwrights.

This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

## Terms.

To mail subscribers—Four Dollars per annum

## Club Rates.

Five Copies for Six Months, \$8.

Ten Copies for Six Months, \$16.

Ten Copies for Twelve Months, \$30.

Fifteen Copies for Twelve Months, \$44.

Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2.50. Names can be sent in at different times and from different Post offices. Specimen copies will be sent gratis to any part of the country.

## EWE &amp; SMITH, Publishers,

Room 27, (formerly U. S. Court Building, Corner Washington and Battery streets, San Francisco.

**FOR SALE.**

One Upright Post Drill, Putnam's manufacture. Also one thirty-inch screw Chuck,  
San Francisco, July, 1883. je13

**50 lbs. MARINE and**

**Fire-Proof Paint,**

MANUFACTURED BY THE PACIFIC METALLURGICAL Works in this city, for Hulls and Decks of Vessels from ground Mineral Rock contains Arsenic, Copper, Litharge and six other Minerals. When used on the Decks or Bottoms of Ships, it is equal to a coat of Stone, and quite equal to Copper, no worms will ever effect it, and cheaper than any other paint.

## DIRECTIONS:

For Decks of Ships, use two parts Mineral Paint, one part White Lead, mix with Linsed Oil.  
For Bottoms of Vessels, use one part sulphur, three parts Mineral Paint, mix with Coal Tar and apply it hot.

For sale by all Ship Chandlers and Tradesmen, in boxes of 60 lbs. each, or by the Pacific Metallurgical Works.

**25 POUNDS FIRE-PROOF PAINT.**

When used on Roofs, Buildings, or Fences, it is equal to covering them with a coat of Stone, being perfectly Fire Proof, and costing less than any paint.

## DIRECTIONS:

HOUSE:--Mix three parts Mineral Paint with one part white lead, thin with Linsed oil: if a lighter color is wanted, mix less paint, more lead.

ROOF:--Five parts of Mineral Paint, one part white Lead, mix with Linsed oil. Put it thick on a tin Roof as one coat when properly applied will last three years.

Miners' Foundry

—AND—

MACHINE WORKS,

First St., between Howard & Folsom,

SAN FRANCISCO.

EVERY DESCRIPTION OF IRON AND BRASS Machinery, the Best and Most Economical, manufactured in the state of California, will be furnished with dispatch at the Miners' Foundry and Machine Works, as:

Steam Engines and Boilers, Flour, Saw and Quartz mill machinery, Mining Pumps, Amalgamators, Retorts, Etc., Etc., Etc.

Particular attention will be given to the manufacture of Machinery in Sections, designed for places of difficult access. Various models of Quartz Crushers, Amalgamators and Water Wheels—some in operation and on exhibition.

Parties desiring to test their ores practically, in small quantities will be afforded ample facilities, free of cost.

All parties desiring accurate and highly finished drawings and Superior Machinery, at most reasonable rate are cordially invited to call before contracting elsewhere.

HOWLAND, ANGEL & KING  
San Francisco, February 23, 1863.

## New Patent Agency

WE HAVE CONNECTED WITH THE Publication of the "MINING AND SCIENTIFIC PRESS"

The Patent Agency Business,

And would invite Inventors and Discoverers on the Pacific coast, who wish Dispatch as well as Economy to call upon us. We have an Experienced Agent at Washington, which, together with our own experience of several years, renders the

Mining and Scientific Press Agency

The most desirable place to make application for Letter Patent on the Pacific coast. Apply at

Office of the "Mining and Scientific Press," Room No. 27, Federal Building, corner of Battery and Washington streets, (directly opposite the Post Office.) San Francisco. EWER & SMITH.

## FOREIGN PATENTS OBTAINED

By application at this office, Room 27, Federal Building

EWER & SMITH, Solicitors.

## NOTICE TO INVENTORS.

Inventors wishing to file Caveats should apply at this Office, Room No. 27, Federal Building. Terms moderate.

EWER & SMITH.

## PATENT RIGHTS.

Patent Rights Bought and Sold,  
At the office of the "Mining and Scientific Press" Agency.  
EWER & SMITH.

## IMPORTANT TO INVENTORS.

Inventors who obtain their Patents through this Office can have their Inventions illustrated and described the columns of this paper FREE of charge, they more furnishing the engravings. We are also prepared to furnish engravings at reasonable rates. Those who do not care to go to the expense of having engravings prepared can have their inventions fully noticed and described in our columns, free of charge. The free use of our columns to aid them in introducing their inventions to the public will be found a most important advantage to inventors.

#### AN IMPROVED FURNACE.

MR. EDITOR:—The following quotation from Wells' Scientific Annual, for 1863, gives many details of improvements required for converting fuel into a gaseous form before its application to heating. This forms the basis of one of the Norwegian methods for the treatment of Copper pyrites. It will therefore form a useful prelude to what I hope to send you, shortly, on this subject. In the recent International Exhibition, in London, metal was exhibited manufactured by this means, in other parts of Europe. Instead of the fireplace of the common reverberatory furnace, a 'gas generator' is employed.

"This consists of a circular chamber of fire-brick several feet deep, and two or three feet in diameter, closed at the bottom, and having a hopper at the top, through which the fuel is supplied. This chamber, at a certain height from the bottom, is in direct connection with the body of the furnace, so that flame may issue as freely from it as from the fireplace of an ordinary reverberatory furnace. In the sides of the generator, at a certain distance from the top, is a series of three or four small, round holes on the same level, and at some distance lower down is another similar series of round holes. These holes are for the passage of the air intended to support combustion in the interior of the generator, which is blown in either by a fan or some other convenient blowing-machine. Now, when the generator is full of incandescent fuel, and air is injected through the lateral holes, carbonic oxyd gas is copiously produced and passes into the furnace, as there is no other place of egress, the hopper at the top being supposed to be shut. As it escapes from the generator, it is met by a current of heated air, or as it is technically termed, 'hot blast,' which is injected downwards from the roof of the furnace at or near its junction with the generator, either in several jets or one continuous sheet. The carbonic oxyd while still hot is thus burnt, with more or less air at will. The air which supplies the generator is also previously heated; and in the Swedish furnaces the apparatus for heating the blast consists of a series of cast iron pipes fixed at the lower part of the stack. Hence only the waste heat of the furnace is employed for this purpose. It is usual to place a hollow cylinder of iron round the generator, so as to leave a closed space between its internal surface and the exterior of the generator; and into this space the hot blast is introduced, whence it passes through the two rows of holes previously described into the interior of the generator. The atmosphere of such a furnace can be rendered either reducing or oxydizing at will by regulating the amount of blast. At the bottom of the generator is a door, by means of which the ashes or clinker from the fuel may be withdrawn. These furnaces can be so modified as to suit any kind of fuel. A recent writer in the London Times advocates their use even for the burning of anthracite. He says, 'This kind of coal gives intense local heat, but this inconvenience might easily be remedied by introducing along with the air into the generator a certain proportion of steam. This steam would be decomposed, with the formation of carbonic oxyd and hydrogen gases and some carbonic acid, and a considerable re-

duction of temperature would be the result. But the heat thus removed from the chamber would be subsequently restored in the body of the furnace by the burning of the combustible gases derived from the decomposition of the steam, so that there would be no loss of heat, but only a transfer of it from the generator, where it is not wanted, to the furnace, where it is applied. The fact is, our mineral fuel has been so abundant, and so easily accessible, that it has been most cruelly wasted. But matters are not quite so smooth as they used to be, and necessity is beginning to compel attention from our iron-masters to the subject of economizing fuel in every possible way. The old reverberatory furnace is only a clumsy sort of gas furnace; but in the Swedish peat-furnaces the fuel may be converted into combustible gas, which may be applied under the most advantageous conditions."

#### A POOR CHEMIST.

#### ANCIENT AND MODERN EFFORTS TO DRAIN LAKE FUCINO, ITALY.

Those of our engineers who may traverse Southern Italy in the course of their travels this year, will find an interesting work proceeding in the northern provinces of Naples—in the Abruzzi—not far from the frontiers of the Roman States, in the works for draining Lake Fucino. This lake consists of a vast pool of water entirely surrounded by mountains. From very remote periods, attempts have been made to drain it without success. Last year, on the 9th of August, a company, founded by the Roman banker, Prince Torlonia, after eight years labor, succeeded in turning the waters of the lake into the river Liri, which flows into the sea, near Gaeta, through a tunnel about four miles in length. When the drainage arrangements are complete, nearly forty thousand acres of excellent land will be brought into cultivation; and thirty thousand inhabitants of the mountains, who are every year driven by the snow storms to take refuge and seek labor in Tuscany and the Roman States, will find employment in the drained bed of this lake. "Julius Cæsar planned the drainage of Lake Fucino," says an Italian writer; but the Emperor Claudius made the first attempt. Pliny describes the wonders of a tunnel following the sides of a mountain at a depth of a hundred feet. And it was, indeed, an astonishing attempt in those days, when the engineers had none of the appliances of modern science. Claudius employed thirty thousand men in the attempt for eleven years, and exhausted the public treasury. When he believed that his work was complete, he celebrated the event by one of the greatest naumachia, or water fights of the Roman times, in which nineteen thousand men, divided into two fleets, fought to the death, "to make a holy day." Claudius, Agrippina, and young Nero (who, a few months later, became master of the Empire,) the imperial court, and an immense crowd of spectators, were present at this fearful and imposing gladiatorial contest. When the play was played out, the dam which stayed the waters from the tunnel was removed, and they rushed in with a roar, but soon balled back. The tunnel was a failure! The cause of this failure re-

mained hidden for centuries. The work was recommenced under Trajan and Adrian; still later, by Frederick II., in 1240; by Alphonso I. of Arragon, in the seventeenth century; and, lastly, by Frederick I. of Naples, in the eighteenth century; but all failed. In 1826, Afan de Rivera, Chief of the Public Works in the kingdom of Naples, obtained leave to clean out the cut or drain made by Claudius. This work was finished in 1835, but the problem of draining the lake was as far off as ever. At length, in 1853, a Neapolitan company obtained permission to drain the lake, and take the reclaimed bed for their remuneration. On investigation, it appeared that the tunnel constructed under Claudius had not been so planned as to draw the water from the lake. The Emperor was cheated by his Minister of Public Works. The engineer of the modern company finally decided to destroy the Roman work, and make one of double the dimensions. Our account does not come down to the final completion. We suggest the subject to the attention of young tourist engineers and our illustrated periodicals.—*London Journal of Gas Lighting*, April 7.

CASTING AN ANVIL BLOCK, WEIGHING ONE HUNDRED TONS, AT THE MIDLAND WORKS, SHEFFIELD.—Messrs. Stanley & Co., iron founders, Midland Works, were occupied the greater portion of Friday in casting a monster anvil block, weighing one hundred tons—by far the largest casting ever made in England. At an early hour the workmen were busily engaged at the furnaces and in the foundry getting everything in readiness for the actual operation of casting, which began about eight o'clock, and continued under the personal superintendence of the Messrs. Stanley, until three o'clock in the afternoon. The mould—to the uninitiated only an immense hole in the earth—was situated in the centre of a spacious casting room, having on each side a powerful crane, by which the molten metal was conveyed in ponderous "ladles" from the furnaces to the mould. As the burning flood rolled into the fiery pit, sheet of flame and clouds of smoke rose seething and scorching from the mass, and innumerable stars of strange beauty and brilliancy darted forth in every direction, to the manifest disquiet of the mere curious spectators who had approached venturously near the spot. There were many gentlemen and several ladies present, and great gratification was evinced at the scene they witnessed—not forgetting the manly readiness and energy with which the grimy and perspiring workmen performed their important and often dangerous parts. About a quarter past two o'clock the "dross" which had accumulated upon the surface of the metal in the mould, now almost full, was dragged off, and the top of the mould closed over, the remainder of the requisite metal being poured into it through a central aperture. The metal run from two large cupolæ and two air furnaces. The anvil is intended for a 12½ ton Nasmyth's double-acting steam hammer, resting on a foundation of oak blocks, eleven feet square by four deep, and one hundred and twenty large piles driven ten feet into the ground by steam power. The hammer is for forging the homogeneous metal for the large Whitworth guns and projectiles, marine engine cranks, and other shafts weighing from five to eight tons each.—*Sheffield (Eng.) Tel.*

## MINING CORRESPONDENCE.

EL PASO MINING DISTRICT, LOS ANGELES CO.,  
MESQUIT SPRINGS, JULY 12th., 1863.

Messrs. Ewer & Smith:—On Friday, the 9th. inst., Sackett's Express arrived from Los Angeles en route for Salt Range, and brought me a fine lot of your papers posting me up to the date of No. 34.

On Saturday morning I walked to Ophir City, fifteen miles from here, situated at the extreme north end of this district, to see what was going on there, and obtain specimens for your cabinet. I started between three and four in the morning, lost the trail, but found and followed the wagon road which made my trip three miles further than by the trail.

I found there six camps pitched around in a square of an acre of ground, on the side of the mountain called Laurel Hill, with a fine spring at one corner of the square, at an elevation of 150 feet, or more, above the plain.

I find the task of collecting specimens far more laborious than I expected, but I intend to persevere till I have a goodly number in your hands.

I hope you will label all that I send, that they may make a fair show for our district.

As the cost of forwarding fifty specimens would be but a trifle more than for twenty, I shall wait till I have gathered all I can conveniently, and will endeavor to give a description of their appearance.

There are but three lodes being developed at this time. These are the Milliken, No. 1., Manzanilla and Newport, and but little has been done on them, as they are approaching them by tunneling and of course can show no rock from below the croppings. Work will be commenced on the Tucker or "Iron Clad Company's" lead soon. It is so hot here, (July 14th., 10 A. M., the thermometer shows 108° in the shade,) that men cannot work outside, so nearly all are laying off, waiting for help and tools.

C. W. TAPPAN.

HUMBOLDT.—Where are our Humboldt correspondents? We have not heard from them for some time. We have learned incidentally however, that several letters have been addressed to this office, and that the writers are complaining of their non-appearance in our columns. The letters referred to never came to hand. There is a screw loose somewhere; all right, however, at this end of the line. We hope soon to be able to post our readers again in regard to the condition and progress of mining interest in Humboldt.

THE UNITED STATES TUNNEL AND MINING COMPANY.—This Company have been long engaged in prospecting their mine, and are now about to be rewarded for their toil and expenditure. After running their tunnel 1,600 feet, they have now struck rich quartz in veins of about six inches in diameter, with every prospect of soon reaching the main lead. About \$30,000 have been expended upon their tunnel. Enterprises of this character deserve a rich return.

COPPER MINING ABOUT MOUNT DIABLO.—The work goes steadily on, and in a number of claims the owners seem to be on the eve of realizing a full reward for their labor. Very fine specimens have been shown us from Mount Zion, and we learn that the company have several tons of ore sacked ready for shipment. The Keokuk, Last Chance, and a number of others, including the Hall claim, in Alamo District, have obtained the most encouraging results thus far.

SANTA CLARA.—The news from all the prospecting companies in the hills around Santa Clara is encouraging. At Lexington they are progressing, and are sanguine of striking the vein. Bituminous coal of an excellent quality has also been struck, and no doubt is now entertained of its being in paying quantities. Several influential citizens of this place have been out to a copper discovery—the Savage claim—and a company is formed to thoroughly explore and develop it. The prospects are said to be better than they were at Copperopolis.

The oil springs at Lexington, it is said, are to be developed, and an excellent article of crude oil has been brought in from the springs.

## THE PLAN OF CREATION.

BY PROFESSOR AGASSIZ.

The animal life of our globe shows that it has been formed with the design of bringing forth man as its last and highest creation. The history of the earth during those inconceivable periods of time before the human race was created has been traced by the united labors of astronomers and geologist.

By the theory of Laplace, which is now generally accepted, it is supposed that the solar system once existed as a nebula, a vast distended flat mass of fiery particles of matter, revolving upon its axis. As it cooled it contracted, and threw off rings on its outer edge, like the rings of Saturn. These were then drawn together into globes of molten matter.

Between the time at which the astronomical history ends and that at which the geological begins, there is a period which has not been examined, because there is no man competent to undertake the investigation. As frequently happens in science, we must wait for another generation to be educated for this work; for, learning the art of investigation is the labor of a lifetime.

Geology finds the earth in a state of igneous fusion. In examining the rocks of the earth we find that they consist of two classes. Those of one class are formed in layers like the leaves of a book, while those of the other class are simple masses without stratification.

The stratified rocks were formed by being deposited at the bottoms of seas and lakes. Let me present some of the evidence by which this fact is known. All except the very oldest of the stratified rocks are filled with animal remains—especially with shells. Now we find these remains always lying upon their broad surfaces. If a shell falls through water and rests upon the bottom, it will not rest upon its edge, but upon its side; and the fact that the shells contained in the rocks always have their broad surfaces parallel with the planes of stratification is one of the proofs that these rocks were deposited in water. Many of these rocks now lie in a slanting position upon the slopes of mountains, but as we find the shells which they contain with their broad surfaces parallel with the planes of stratification we have no doubt that these rocks were formed and hardened in a horizontal position.

The stratified beds have been raised into a slanting position by the rocks from below being pushed up through them. The central mass is of unstratified rock, with the stratified rocks lying upon its sloping sides. We know that these rocks have been raised in this manner, not merely from the broad surface of the shells being parallel with the planes of stratification, but also from the fact that we find the same kinds of rock lying one on another in the same order on both sides of the mountain.

When the unstratified rocks were forced up among the rocks lying above them, they were in a state of igneous fusion. This is shown in the fact that they have run into and filled the crevices and cavities in the stratified rocks, which they certainly could not have done if they had been in a solid state. The fact is farther proved by the alteration which they have made in the portions of the rock with which they came in contact. We know that if marble is put into the fire it will be reduced to quicklime; and that if sandstone is highly heated it is formed into coarse glass. The effects of heat upon rocks of various kinds is well known, and we find these effects wherever the mass from below has broken through the stratified rocks. There can no doubt that that mass was in a state of igneous fusion.

All over the world the highest mountains have been raised up since the lower ones. The oldest mountains on this continent are the Capotian, extending in an easterly and westerly direction north of the great lakes. The Appalachian chain is older than that of the Rocky mountains. So in Europe, the Alps are newer than those of less elevation. This is what we should have expected if we had reasoned on a sound basis. When the hard crust of the earth was comparatively thin, it would yield to a slight force of upheaval, but as it became thicker from the gradual cooling of the globe, it would require a greater force to break it up, and, consequently, the forces accumulated and produced proportionally greater effects.

When we find one rock which has unquestionably been deposited upon another rock, it is manifest that the one ly-

ing below was formed first; and thus we are furnished with sure evidence of the relative ages of the rocks. The successive layers of rock are like the pages of a book, arranged one after another in regular order.

Now let us take a general view of the history of animal life, as preserved in this record. The rocks of the earth are naturally divided into several classes, resting one upon another.

At the bottom we have the unstratified rocks—granite, sienite, trap, &c., and above these the stratified rocks named generally from the localities in which they come to the surface.

The lowest of the stratified rocks contain no animal remains, and are therefore called azoic. But in the silurian we find four orders of animals; the radiates of which the starfish and the coral are samples; the moluscs, to which the oyster and clam belong; the articulates, embracing the lobster and all insects; and even the vertebrates are represented in certain low forms of fishes. This commencement of the creation of animal life upon these four modes of structure shows the formation of a determined plan from the beginning—a plan that embraced the creation of man as its final culmination.

The three lower orders are represented by all the classes which now exist, but at the beginning there was only one class of vertebrates, the fishes. After a long time the reptiles were created, then birds, and finally animals, to which class man belongs. The lower orders are not represented in the older rocks by the same species which now exists, but even in these there has been some degree of improvement—a general tendency to a higher and more complex structure.

The several species have not been gradually developed one out of another, but in each case a new creation has succeeded to the old.

The rocks nearest the mountain being the most inclined in this way, then other rocks lapping over them and less inclined, till we come to the upper rocks, which are generally horizontal or nearly so. As the shells in these rocks and other evidences prove that they were all deposited in a horizontal position, it is evident that they have been inclined one after another by successive upheavals of the mountain. The injection of a vast mass of matter in a state of igneous fusion must have destroyed all animal life in the adjacent waters, rendering a new creation necessary. The persistent following of the same plans through all of these successive creations shows the existence of a preconceived design.

DISCOVERY OF A CAVE IN WASHOE.—The Virginia Union has the following:

J. W. Rawlinson, of Palmyra Dis't, called upon us and gave us the particulars of a strange discovery which was made in that District last week. A party of three men were out on a prospecting tour, between the towns of Palmyra and Como, when they were startled at making a "strike" of a character far from being anticipated, in fact, no less a great natural curiosity than a large cave. The entrance to it is by a long hall, or natural tunnel, about 400 feet in length, and varying in width from 10 to 100 feet; at several places widening into small chambers; the sides are for almost the whole distance, of solid rock and in several places worn so smooth that it is almost impossible to believe that it has not been done by the hand of man. At the end of this, is a chamber the sides of which are rough and broken, but of great height and size. Leading from this are four other short avenues, or halls, some of them so low that a person is compelled to crawl through them, each of them, however, widening at only a short distance into small chambers. There are supposed to be other chambers, and probably of great extent, but at the time Rawlinson left it had not been sufficiently investigated to determine this. The most important and useful part of the discovery, however, is that there were also discovered, far in the interior of this immense cavern several splendid looking silver and gold bearing ledges, and numerous excellent indications. When these facts became generally known in the neighboring towns, great excitement was caused, and there was a tremendous rush of fortune seekers for the new land of promise. Claims were located in every direction, and the search for new ones was still continuing. This adds still another to the many natural curiosities to be seen in our wonder-producing Territory.

## NICKEL MINE IN ITALY.—FOREIGN MINING AND METALLURGY.

A joint-stock organization for working nickel bearings at Crivino has just been formed, under the title of Boulart, Boucher & Co. The capital of this enterprise is £29,000, divided into 1,450 shares, of £20 each. Nickel is a scarce and dear metal, the use of which is everywhere extending. The governments of Belgium, Italy and Switzerland have introduced it into the composition of a portion of their coinage, and it is more especially in the mixtures with copper, tin, zinc or cobalt that it is utilized. The works which apply themselves to the treatment of this metal are not very numerous; there are some in England, one in Belgium, and several in Germany; but this branch of metallurgy has not a greater development, in consequence of the absence of sufficient supplies of nickel minerals. Some workings of nickeliferous minerals exist in Germany and Italy, and it is in the province of Susa, in this latter country, that the Mine of Crivino is situated. To pronounce an opinion on a mining working is always a difficult and delicate matter, as, independently of special knowledge, a perfect study must be made of the locality. But Signor Sella, engineer of the district in which the Crivino mine is found, and formerly Finance Minister, observes: "The undersigned concludes that the works executed by M. Boulart have shown an arsenious vein of cobalt and nickel in a gangue of dolomite lime, quartz, and talcous and winding schists, with which it is intermingled. This vein inclines almost vertically to the West, and the metalliferous threads which it comprises vary in power from a very minute fraction to five-eighths of an inch. The undersigned is of the opinion that the works executed up to the present time have presented sufficient indications of a mine of nickel and cobalt; and, although the metalliferous power of the mine may not be considerable, yet having regard to the high price of nickel a very small quantity will pay the expenses of extraction, and the undersigned, therefore, hopes that the Crivino Mine can be worked at a profit, and believes, in consequence, that it may be declared open in accordance with the terms of the 15th Article of the Code of 1814." After having indicated the analogy existing between the Crivino Mine and that of Usseglio, Signor Sella observes that the discovery of veins on the extreme limits of a formation of cobaltiferous and nickeliferous veins may involve a fair presumption that a fine future is in store in connection with their working.—*London Mining Journal*.

## THE PYRAMIDS—HOW BUILT.

Herodotus, who visited Egypt 445 B. C., gives us some account of the herculean labor there performed. The stones were brought from the mountains on the opposite side of the valley of the Nile. The first work was a giant causeway or road, over which these enormous stones could be transported. Ten years, he says, one hundred thousand men were employed in this part of the work. After the building of the road came the levelling of the rocky hill, the cutting out of the subterranean chambers, and the elevation of the huge masses of stone. This, the same writer says, occupied three hundred and sixty thousand men twenty years longer! The first layer of stones were easily put in their places: the second were elevated by the aid of machines or derricks. Then, as the heights of the mass progressed there were a series of broad steps, corresponding to the number of layers of stone; as the work proceeded, these machines were planted along the ascent and the stones elevated from step to step.

Such is the structure we have come to examine, and which now stands before us in all its huge proportions. What an immense labor! What countless years of human toil! What a story of crushing despotism and hard earned slavish servitude! But they were built, and here they stand, and here they have stood for thousand of years, defying the wasting hand of the barbarian, the storms of the desert, and the lightnings of heaven; looking down in proud contempt upon the fierce conflicts of human passion, and conquering nations have come to deluge with blood, and heap with carnage those beautiful plains above which they lift their lofty heads!—*Israhelite*.

Tobacco smoke blown into to the wound is said to be a sure cure for the lockjaw.

## TO MINERS AND PROSPECTORS.

In view of the frequent accidental discoveries of valuable mineral deposits, other than gold, in almost every section of the State, which have of late been made, it is but reasonable to suppose that prospecting even in California, has but just commenced. The simplest and most universal of all metalliferous deposits is gold. It rarely occurs in any other form than that of "free gold" which is readily discernable to the naked eye. An examination of any rock or earth for gold is an extremely simple process. If its presence is suspected in alluvium, the simple washing of that alluvium in a pan is an invariable test. If in rock of any description; that rock pounded fine in a mortar and washed, in the same manner as alluvium, will usually expose its gold to the naked eye, if there is any there in paying quantity. The only exceptions, are where the gold is contained in iron pyrites, or copper pyrites containing also iron. In either of the two latter cases the presence of gold may be readily ascertained by placing the pyrites in any suitable vessel and keeping the contents at a moderate heat for from four to six hours, with frequent stirrings, by which means the sulphur will be evaporated, and the copper, if any is present, changed to a dull red color, and the gold retaining its natural appearance, on subjecting the whole to the usual panning process, may be readily seen by the naked eye.

Not so with other metals. Silver, copper, zinc, nickel and many others appear in such a great variety of metalliferous forms as generally to defy all but the most practical and scientific eye. No description of these ores can be written which will afford any very important aid to the inexperienced in making explorations. After reading descriptions, however, and carefully examining the specimens described, the explorer may go out and search with some degree of confidence and intelligence. A study of the characteristics of the sulphuret ores alone, would lead an explorer to pass over, entirely unnoticed, the richest varieties of the ores known as Chlorides or Horn Silver, which, from the facility with which they may be worked, and their usual richness, are generally considered the most valuable of silver ores. There is much reason to believe that this variety of silver ore will be extensively found in all the volcanic regions of this State. So with many other ores.

Considering the great difficulty, in the present lack of cabinet collections, and other means of instruction, to acquire a practical mineralogical and geological education in this State, and desirous to aid, to our fullest capacity, the development of our mineral resources, we hereby make the offer to miners, prospectors and all others, who in their travels or explorations may come across specimens having the appearance of rarity or value, to carefully examine and pronounce upon the same, free of charge, as to their characteristics, value, etc., whenever any such specimens are brought or sent to this office free of cost to us. We have already been called upon in many such cases, and we shall at all times be willing to give our attention to any such requests which may be presented to us.

In carrying out the plan we propose, every miner and prospector should be at all times on the lookout for any new mineral. The ordinary rocks with which the miner meets in his travels and labor, and which possess no mineral value are usually well known. Whenever a rock presents any unusual appearance in conformation, color or other characteristic, attention should at once be given to it. There is scarcely a piece of quartz or rock of a quartzose nature, which presents any uncommon appearance in texture or color that has not been thus modified by the deposit or intrusion of some mineral substance. If such rock is found upon or near a vein of quartz it should be carefully examined "in place," and if the cause of its peculiarity is not evident and readily seen, it should not be passed carelessly by. There may be value in it, although the gold may not shine there. We shall commence in our next issue a series of articles describing as accurately and as intelligibly as possible all the ordinary mineral substances which may be likely to come under the notice of the California prospector. These articles will be published under the head of "THE MINER'S LABORATORY," and will be found of great value to the mining public. [*Mining and Scientific Press*, April 20.

## SUGGESTIONS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in this country, is worth equally as much in England and some other foreign countries. Four patents—American, English, French and Belgian—will secure an inventor exclusive monopoly to his discovery among one hundred millions of the most intelligent people in the world.

The facilities of business and steam communication are such, that patents can be obtained abroad almost as easy as at home. The majority of all patents taken out by Americans in foreign countries are obtained through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. Having established agencies at all the principal European seats of Government, we obtain patents in Great Britain, France, Belgium, Prussia, Austria, Spain, etc., with promptness and dispatch.

Models are not required in any European country, but the utmost care and experience is necessary in the preparation of the specifications and drawings.

When parties intend to take out foreign patents, engravings should not be published until the foreign applications have been made.

CAUTION.—It has become a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. We caution the latter against heeding such applications as they may otherwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrust their cases to the care of a competent, reliable agent at home.

While it is true of Most European countries that the system of examination is not so rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitors, in order that they may stand the test of a searching legal examination; as it is a common practice when a patentee finds a purchaser for his invention, for the latter to cause such examination to be made before he will except the title.

It is also very unsafe to intrust a valuable invention to any other than a solicitor of known integrity and ability. Inventors should beware of speculators, whether in the guise of patent agents or patent brokers, as they cannot ordinarily be trusted with valuable inventions.

SUBSCRIBE.—Are you a miner and not a subscriber to the MINING AND SCIENTIFIC PRESS? If so, you are an annual loser of many times the price of a year's subscription, particularly if you are engaged in quartz mining. The same amount of practical information, important to miners and mechanics, which is contained in a volume of the Press, cannot be bought from the shelves of any bookstore in the country for the price of several year's subscription. Do you ever send a paper to the "Old Folks at Home?" If so, and you desire to send important information and valuable reading matter, you can find no paper that will be read with so much eagerness by them, or one that will convey to them so full an account of the real industry of the country as the MINING AND SCIENTIFIC PRESS. We invite all to send us their names and four dollars, or two dollars for six months, and become patrons of the only mining paper printed on the Pacific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examination, and with the hope that it may so far meet with their approval as to warrant their subscribing for it at once. It is not our usual custom to receive a subscriber for less than six months; but inasmuch as we are anxious to introduce the paper where it is not now known, we will, for the present, send the Press for three months even, on the receipt of one dollar, in coin or stamps. It is our belief that no one will wish to discontinue the paper after being a constant reader of it for even that short period.

## Our Mint, its Rules, Charges and Operations.

For parting silver from gold when gold is below 300-1000ths fine ..... 3cts per oz.  
" from 30-1000ths, to 750-1000ths fine. 7 cts " " oz.  
" " 750-1000ths to 950-1000ths " 14 cts " "

## DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce  $\frac{1}{2}$  per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300 3cts. per oz. gross weight  
301 " 500, 7cts, " " "

## DEPOSITS FOR FINE BARS

\$1 16-4-11ths cents. per standard ounce,  $\frac{1}{2}$  per ct. gross value of silver for making bars; also when gold is contained  $\frac{1}{2}$  per ct. on gross value of gold for coining. Refining charges as in purchases.

## BARS SOLD FROM REFINERY.

\$1 21cts. per standard oz.  $\frac{1}{2}$  per ct. gross value to be added for making bars.

## DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. cents per standard oz.  $\frac{1}{2}$  per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

## DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz.  $\frac{1}{2}$  per ct. gross value of deposit for making bars.

## THE MINERS' LABORATORY.—NO. XII.

## SILVER.

Before describing the various ores of silver, it would be best to place before our readers some of the most prominent and characteristic tests for that metal, and in order to do so we must suppose that the miner has made a solution of pure silver by dissolving it in nitric acid—dissolving, say 20 grains in about  $\frac{1}{2}$  an oz. of acid, and adding 3 oz. of pure water to the whole, and dividing the solution into six equal parts, then proceeding as follows:

To No. 1, add a solution of Sulphurated Hydrogen, which will produce a black precipitate or sediment.

To No. 2, add Sulphate of Ammonia, which will produce the same kind of reaction as No. 1.

To No. 3, add Hydrochloric Acid (Muriatic Acid or Spirits of Salt), which will produce a kind of white curdy precipitate or sediment—this sediment will disappear on adding to it a small quantity of liquor ammonia, and will reappear again on adding to it a few drops of nitric acid.

To No. 4, add a solution of Chlorate of Potash which will produce you a brick red precipitate or sediment. This is a very characteristic test for silver in solution.

To No. 5, add a Solution of Potassa, which will produce a brownish black precipitate or sediment. If you collect this sediment on blotting paper, dry it, and heat it in a small dish, you will convert it into metallic silver.

No. 6.—In this portion place a strip of bright Copper for a few moments, and silver in the metallic state will be deposited on it.

It would be well if all parties intending to test minerals for silver, would make themselves thoroughly familiar with these reactions. Other metals giving almost similar reactions, parties, not thoroughly acquainted with the tests for pure silver, are liable to be misled, and to think that they have silver when in reality it is some other metal. In order to illustrate this more plainly, we will suppose ourselves, for a few moments examining the contents of several bottles for silver. In the first place we would label these, No. 1, 2, 3, 4, &c., we would then take a portion of No. 1 bottle and add to it a solution of Hydrochloric acid—a white precipitate would lead you to think that No. 1 was the bottle which contained silver in solution. But in reality it may be either silver, lead, mercury, antimony, or bismuth, and our next point would be to ascertain which of these metals are in solution. This can be proved as follows: Pour the clear liquor from the sediment and boil the sediment with about  $\frac{1}{2}$  of an oz. of Hydrochloric acid for a few moments. If the precipitate dissolves, then it was not silver, but antimony or bismuth. Should it not disappear, pour the clear solution away, and boil the sediment a second time with considerable water, say 1 oz. Should the sediment dissolve, then lead was in solution, and not silver. Should the precipitate not dissolve, pour the clear liquor away again and add to the same sediment liquor ammonia. Should the sediment turn black, then mercury, but if it dissolves, leaving a bright clear solution, then silver is the metal held in solution.

In our next issue we shall describe the ores of silver and how to discover the presence of that metal in such combinations as the miner may come across; but we will say that it is absolutely necessary that he should first be thoroughly acquainted with the tests and reactions of pure silver as laid down by me in the commencement. P.

**COPPER ORE.**—Copper ore of a rich quality has been found in British Columbia. A lead of native copper has been discovered within ten miles of Victoria.

**THE EDITOR** has been absent from his post during the past week on a short trip to the copper mines of Calaveras and Amador.

**CARIBOO.**—Many of the claims on William's Creek, B. C., are paying enormously. Some yield over a hundred pounds of gold per day.

**THE PACIFIC MONTHLY.**—The Pacific Monthly for August, is out. Among the good things contained in it, is a list of "The Prominent Men in California in 1846," by Thomas O. Larkin, Esq. This must be interesting to all new-comers, as well as forty-niners.

[For the Mining and Scientific Press.]

## THE APPLICATION OF PHOTOGRAPHY TO MINING.

When St. Victor first made his experiments in the application of light to sensitized surfaces, and aided by Daguerre, worked out the great problem which they were both endeavoring to solve, he little thought what an immense advantage would arise to the world at large, from his making a practical thing of the action of light upon metallic oxides.

The casual observer as he passes the numerous groups of photographic pictures which meet his gaze in almost every street, looks upon the art as something that panders to the vanity of the multitude, or tends to keep alive the bonds of memory. Even the most practical men, those who are engaged in the development of the resources of the country, in their hasty conclusions, deem that the work of the photographer, is but an idle occupation, and of no actual benefit save to the operator himself.

But while the astronomer takes pictures of the sun, moon and stars: while the mechanic obtains views of his machinery, so perfect in perspective, so accurate in proportion and detail, that they may serve as working plans; and while the architect produces admirable representations of the buildings he constructs, all, with the camera, the mining engineer also does in many instances avail himself of the same method to illustrate the advances he has made in his labors, and to show the grounds upon which he is working.

It is seldom that the Board of Directors ever visit the mine; the stockholders themselves rarely travel thitherward; and all the information which they gain of the progress of the work, or the character of the country at the mine, is derived from the terse and sententious reports of the manager. Did the manager understand the use of the camera, a knowledge which is very easily acquired, he could show from actual views, the progress made in his work, weekly, or monthly, as might be desired. He could present pictures of the mine and its surroundings, show the bearings of the outcrop, the trend of the vein, the features of the adjoining country, and in fact, each, and every minutiae, that would aid greatly in satisfying the Board of the correctness of his system, and in familiarizing them with the property whose interest are in trusted to his guidance. When the construction of buildings or the erection of machinery is progressing, a few minutes work with the camera, at the close of each week, will show the exact stage of the advance made since the last view was taken. So much wall has been built, so much machinery has been put into position, so much excavation has been made, and the quick action of the camera has told the story more plainly, more truthfully, than a volume of words could do.

Much of the value of the vein, can be foreshadowed by the physical features of the country in which it is situated. If easily accessible, even a low grade of ores could be worked profitably, while those which might be very rich, would, from the expenditure necessarily entailed upon them, by the difficulties of their position, never be remunerative. Here the camera becomes useful in its correct delineations of the surface, showing to those who reside at a distance from the mine, the actual position of the vein, and the facilities of approaching it. It is true, that an absolute necessity does not exist, for these features of the mine to be presented to the notice of the Board, but it cannot be doubted that the more fully they understand their property the better they will be able to manage it. It is not possible for all to visit the mine, and by actual inspection, and examination, make themselves conversant with all the local details of it; but they can avail themselves of the aid of this branch of science, and bring, as it were, the mine to their own offices, or firesides, and inspect it at their leisure. Those who have seen the views, which have been taken from time to time, by the different artists of this State, of various mining localities, can readily understand, how greatly such delineations must aid in a correct estimate of the value of such properties, by those who cannot visit them in person. Nor is it necessary to be encumbered with costly or heavy and clumsy apparatus; a light and portable camera, with the stand upon which to place it, so light, that both can be carried with ease by sustaining their weight upon two fingers of the hand, with lenses that can be readily carried in the vest pocket, can readily be obtained at any of the photographic warerooms. The writer of this article has a complete apparatus, which is packed in a box about one foot square, containing the camera, glasses for pictures, lenses, and the requisite chemicals; the whole of

which does not weigh over a dozen pounds. And often in journeying through mining districts he has stopped his mule, taken a view and in eight minutes been again upon his journey.

Such is the progress made in the art, that plates are now prepared which may be kept for years, if not exposed to the light, and then be placed in the camera, and a view taken upon them. This advancement in the art, precludes the necessity of carrying bulky packages of bottles and chemicals, while travelling, to obtain good views, and thus places it in the power of any who are so disposed, to bring back with them picturesque delineations of the scenes through which they have passed. It can be rendered practically useful by illustrating the progress of work upon the mines. L.

## CALIFORNIA'S WANTS.

California wants two hundred thousand pair of working hands, one hundred thousand brave and hardy men who are neither too proud nor too lazy to work, but who are willing to labor and wait for the sure results of honest toil. Between the grey ribs of granite, lie buried millions of precious metals which nothing but the strong arm, the drill and the pick, together with the aid of mechanical industry, can bring out; but besides all this mineral wealth California offers a climate and soil adapted to the production of all kinds of cereals as well as fruits and flowers, the rose and the cactus, the fig and the almond tree here flourish; while fields of wheat and barley present to the eye an unbroken surface. With a bracing climate and Italian skies, giving strength and energy to the enervated frame of man, we cannot conceive of too extravagant speculations as to the future of California's developments. Her alluvial and mineral wealth seem to be inexhaustible—almost every day we hear of new discoveries of the precious metals—"Struck it rich" is the phrase which arouses whole communities, and sways the multitude as by some mighty magnet, leaving whitening fields ready for the harvest, uncut, whole settlements depopulated, houses to rent or for sale at low prices; such sudden outbursts of splendid prospects, too often disappoint the wild adventurer, and too soon he finds that he has torn down what he had commenced to build on a sure basis. California does not want such a class of men as those; she has enough of these wild adventurous speculators already. She wants men of iron nerve and sinew, with perceptive faculties to know when they are well off, and "let well enough alone"—men who are "willing to labor and to wait," for results which will surely be remunerative to them, by application and patience. To all such, whether they come from the North, the South, the East or the West, California extends her hands, and bids you welcome.

## OBITUARY.

We are pained to be called upon to record the death of the Rev. BENJAMIN BRIERLY, who departed this life, July 21, 1863, in the city of Nevada, Cal. "Men die, yet their deeds live after them." When good men die, society feels the shock. So with California—she has suffered an irreparable loss, in the death of Mr. BRIERLY. The Church has lost a mighty champion for her rights, Vice and Irreligion, an uncompromising foe; the poor and despised have lost a friend, and one who would not stop to enquire "Of how much sin are you guilty?" but who was ever ready to relieve the necessities of others, to the sacrifice of his own comfort and ease. Many thought him too easily deceived in his charities, but his motto was "Better be deceived many times than to be mistaken once." In religion, he had a childlike faith. Though he has found a grave on California's shore, far from his own native Isle, yet his confidence was in God, and thus neither time nor space could serve to separate him from His presence. Who would fear to die, after life's work had been so well and faithfully done?

**A HEAVY FALL.**—The Territorial *Enterprise* of the 21st ult., is authority for the following:—

Adam Simpson fell down the shaft of the New York Company, 238 feet, night before last, broke his wrist and bruised his head somewhat. Dr. Sharky set the broken bones, and the patient was doing well at last accounts.

WITHIN the last year over eight million dollars in gold dust has been received at the New York assay office from Pike's Peak.

## THE MINING SHARE MARKET.

The activity in the Mining Share Market for the previous week, has been more than sustained during the six days, just past. The buoyancy of the Market has also been particularly noted. The business transacted exhibits a wide range and embraces quite a large scope of leading shares, these latter have been well sustained, by reason of flattering accounts from the mines.

Having been absent from our post, the past week up to the morning of publication, in lack of personal observation, we quote freely and without further credit, from our contemporaries, *The Mercantile Gazette* and *Sanborn and Co's* circular:—

Ophir Shares have been in demand, commencing at \$2000, and gradually improving to \$2350. This sudden recovery on the closing depressed rates of last week, is accounted for by a new discovery of rich ores to such an extent that the company may be induced to declare their regular dividend on the 6th instant, instead of omitting it, as was anticipated. It is announced officially that after September 1st, the dividends will be paid in New York, by Eugene & Co., on the same day they are paid here, less exchange.

Gould & Curry Shares have been sold at \$5275; at the rate \$5300 is offered.

The Mexican Company are vigorously at work upon their new shaft, it having already attained a depth of fifty ft. It is fifteen feet long by five wide and will contain apartments, each four feet square.

Savage Shares have advanced to \$3500, on time. Arrangements have been completed with three Mills for the working of the ores, and, with ordinary success, a dividend of \$75 per foot may be expected for August. Shares are inactive, but well maintained.

Hale & Norcross has advanced \$200 the past ten days and is at present very firmly held at \$2200; \$2300, buyer is bid. This claim is now being thoroughly opened, and new drifts run in several directions to extract ore upon a large scale; a number of mills are constantly engaged in crushing rock from this mine.

Holzer Shares are growing more in favor, and new buyers are ready to pay \$1250. The largest holders are the most sanguine, and cannot be persuaded to part with their stock at much higher rates.

Potosi Shares have been freely dealt in, and have readily commanded \$700 to \$725, most of which have been taken by old holders, notwithstanding the influence of the adverse action of the Grass Valley Company.

Grass Valley is offered at \$255 per foot. Very valuable claims have been found lately (on ground not in litigation with the Potosi Company) giving employment to two or three men.

White & Murphy Shares have been sought after at \$550, without finding much stock.

Best & Belcher Shares have not been offered at less than \$600, and Dick Sides could be sold at \$650.

Sierra Nevada, improved to \$71½; at the close very little stock is offering.

Grass Valley Shares have again been largely dealt in, fluctuating from \$250 to \$170; at the close they advanced to \$195. Fully in this stock is anticipated at an early day. This appreciation is occasioned, it is said, by the probability of there being no dividend for the ensuing month. Dividends of 100 feet, for August, sold at \$1 to \$1½.

Burning Moscow, improved to \$146, and declined to \$120. North Potosi Shares receded to \$42½, and closed at 47½. Lucerne sold at \$26; Lady Bryan reached \$15, and closed at \$12; St. Louis, in demand at \$31¼; Charles City declined to \$52, closed at \$61; Meredith, after selling at \$57½, closed at \$51.

EMERALDA SHARES have attracted more than usual attention during the past week. Wide West has been quite active and Antelope in request. Real del Monte has been in good repute and found buyers at \$225.

Real has improved because of the failure of the suit brought against the Company by the Real del Monte Co. There are no transactions in the stock, but it is firmly held at material advance.

Antelope has revived somewhat, advancing from \$70 to \$80. We append a record of the leading transactions of the

Wide West, 320 shares sold from \$145 (at \$180; Antelope, 10 at \$200; Esmeralda, 30 at \$20 (at \$22; Real del Monte, 25 at \$225; Silver Hill, 95 at \$35 (at \$36; Utah, 25 at \$70 (at \$80; Nevada, 10 at \$20; Pond, 102 at \$21 (at \$27½; Federal Hope, 102 at 40c to 50c; Red, White and Blue, 32 at \$10 (at \$11; Josephine 127 at \$10 (at \$15; Coso, 20 at \$20; Willow Springs, 145 at 4 (at 5¼; Sanborn, 16 at \$2; Bodie Bluff, 75 at \$4; Union, (Rus. District) 916 at \$3½ (at 4½).

HUMBOLDT & REESE RIVER still continue to attract much attention. It is stated that seven mills will soon be in operation at the latter locality, from which important developments may be confidently anticipated at an early day. We append such transactions of the week as have come to hand:—Sheba, 250 at \$220 (at 275; De Soto, 30 at \$60; Reese River, 30 at \$1¼ (at 1½; American Basin, 30 at \$15; Calcedonia Tunnel Co., 40 at \$46 (at \$48; Croesus, 70 at \$10; St. Charles at \$1¼.

## COPPER.

Since our last we hear of valuable discoveries of Copper in Mariposa, and Merced counties which are very flattering, and the mania for locating feet unexampled. Fifteen miles of claims have been staked off. Shafts have been commenced and work is progressing.

In Trinity county prospecting continues and miners are sanguine that rich Copper mines will soon be developed.

From Del Norte we hear of profitable workings. The Alta are shipping ore and rapidly developing their lode; 4000 barrels of ore go forward on the Mary L. Sutton to New York.

At Mount Diablo the numerous companies prospecting their claims continue with unabated zeal to tunnel, and sink shafts.

It is estimated that the Copper mines of Calaveras county will soon afford permanent work to thousands of laborers. The Union continues its large yield of shipping ore, and the stock still appreciates in value.

The Keystone has been largely increasing its shipments and extending its working operations. The Calaveras and Empire are also steadily progressing. At Camp Seco the mines are doing well. The Copper Hill is shipping in fair quantities.

The Napoleon has produced this month about 200 tons of ore, and the amount is being increased as room is made underground.

The last assay of forty-five tons, was made at an average of 17 per cent; 200 tons of ore from this Company's mine go to New York per the Mary L. Sutton, to sail in a day or two. The main shaft has been sunk 165 feet on a lode of 14 feet in width.

Forty tons of ore from the Celorodo have been received as specimens of the yield of that district.

In Butte county several good lodes are being opened and in Yuba we hear that prospectors are sanguine of success.

NOTICE.—In this State, we believe, cases of deaf and dumb are not very common, although cases of deafness alone are so. We personally know many of the latter, where no relief has been obtained under our most skillful physicians. We have, therefore, much pleasure in calling attention to the authenticated cases of cure by Dr. De Castro, which appear in our advertising columns to-day. Those visiting the Dr. will find him a perfect gentleman in every respect, free from all quackery, and worthy of all confidence.

THE Lake Superior Miner states that \$100,000 of silver is obtained annually from the copper mines.

For the information of those of our subscribers who are members of any of the Temperance Divisions of this city, we are requested to state that the next regular meeting of the GOLDEN GATE Division, will be held on Saturday Evening the 8th inst., instead of Thursday Evening. A full attendance is requested. Their "paper," the "Golden Gate Journal," will be read at 9 o'clock.

THE NAUTICAL MAGAZINE.—Capt. John is out again with his valuable Magazine. Capt. John has a keen eye to everything that pertains to the Sea, and is as firm as a rock on the old flag.

## REPORT OF BIDS

At the San Francisco Mining Stock Board,  
For the week ending Aug. 1, 1883.

Names of Companies.	Total No. Shares	Share per ft	Par Value.	Monday.	Tuesday.	Wednesday.	Thursday.	Friday.	Saturday.

## P. M. S. CO.

PACIFIC MAIL STEAMSHIP COMPANY'S line to PANAMA, connecting via the Panama Railroad with the steamers of the Atlantic and Pacific Steamship Company at Aspinwall.

## FOR PANAMA.

The following Steamships will be dispatched in the month of May, 1863.

Aug. 3d, - - - - - Steamer Orizaba.

Aug., 13th, - - - Steamer Golden Age.

Aug. 23d, - - - - - Steamer St. Louis.

Will leave Folsom Street Wharf, with Passengers and Treasure, for Panama

AT 9 O'CLOCK, A. M., PUNCTUALLY,

And connect, via Panama Railroad, at Aspinwall, with steamships for New York.  
For Freight or passage, apply to

A. B. FORBES, Agent.

Corner of Sacramento and Leidesdorff sts.

## WHEELER'S

## Amalgamating and Separating Pans.

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metals arises from the passing off of the same in combination with the quicksilver, during the process of triturating, and in cleaning up. By the introduction of the Separating Pan to follow the triturating this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

\* \* These Pans can be seen in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves.

no16-1f

ZENAS WHEELER.

## Wm. P. TAAFFEE,

IMPORTER AND JOBBER OF

Staple and Fancy Dry Goods,

CARPETS, DUCK, ETC.,

Cor. Front and Sacramento streets,

SAN FRANCISCO.

D. MORRIS,  
MACHINE SHOP,

227 Market, corner of Beale Street.

Manufacturer of

## WARRANTED FIRE-PROOF SAFES

Mill Work, of all kinds made to order. All kinds of Repairing done at moderate prices. jc13

## REMOVAL.

OFFICE OF THE PACIFIC METALurgical Office is removed to 509 Sacramento street. Having enlarged our Works at North Beach, we are now enabled to reduce from 10 to 15 tons of Silver or Gold rock per day.

Gold and Silver ore, and Sulphuret Assayers', or Sil Vermiths' sweepings reduced or purchased.

COPPER ORES—Highest market rates advanced in cash, for shipments. S. C. BRADSHAW, Agent,  
509 Sacramento street, near Sansome.

## SOUTH PARK

## Quartz Mill and Reduction Works,

GOLD AND SILVER ORES WORKED AT REASONABLE rates, and Working Assays made of small lots. All kinds of ores crushed at short notice.

J. H. SMITH & CO.,  
Office in Shiel's Block, opposite Masonic Temple.

S. F. CLOUSER, Secretary,

## CALIFORNIA TOOL WORKS!

John Weichhart,

Manufacturer of

All Kinds of Edge Tools, Etc.,

Plane Irons

Moulding Irons, Stone Cutter's Tools, etc

No. 22 Fremont street, bet Market and Mission,  
San Francisco, July 14, 1863.

THE  
BRYAN BATTERY.

The vast interest involved in the reduction of ores on this coast, renders it of the highest importance that the Machinery employed for this purpose should be of the most Effective, Economical and Durable Character. It may be safely said that Millions of Dollars have already been expended upon the various experiments in this class of Machinery, and it is a fact well known to all who have had any practical experience in the matter, that every new process developed during the past twelve years, has been set down as a failure. The Ordinary Stamp Battery

## ALONE STANDING THE TEST.

This, with the Improvements which Experience has suggested, is now regarded, by common consent, as the only reliable

## METHOD OF CRUSHING ORE.

THE BRYAN BATTERY, as now constructed, is believed to combine all the improvements which the experience of the past has afforded. They have been

## EXCLUSIVELY ADOPTED

by many of the most prominent Mining Companies in the country, and have been, for the three past years, subjected to the most severe of all tests—that of constant use—and in every case have been pronounced

## EFFECTIVE, SUBSTANTIAL AND RELIABLE.

They are now extensively used throughout the mineral regions of California, Nevada and Mexico, and have established a claim to public confidence, never yet equalled in any piece of mining machinery.

These Mills are constructed almost entirely of Iron, and, consequently, are not affected by the intense heat and dryness of atmosphere, common to all mining localities. They are adapted to

## BOTH WET AND DRY CRUSHING,

and are warranted to reduce, with the same weight of Stamps, 25 per cent, more rock than any other mill in use. Each Battery is complete in itself, and forms a perfect mill—while any number of them can be added at a subsequent time—thus preserving the symmetry and uniformity of the Mill

As an evidence of the increasing favor with which these mills are regarded, we would mention that the Celebrated Ophir Company first introduced them into their works in 1860, and have been adding a number of Batteries, each subsequent year, until they now have Nineteen, running Seventy-six Stamps.

They are perfectly fitted and set up at our Works, before shipping, each piece being marked and numbered, so that they can be put up and set at work in ten hours after arriving on the ground. They are made of two sizes, four and five Stamps each. The Four Stamp Battery weighing complete about 6,000 pounds, and the Five Stamp about 7,000. The Mortar Bed being cast in sections, when desired, so that the mills can be packed over any mountain road.

We annex the names of a few well known Companies who have adopted them—running from four to seventy-five stamps each—to whom reference is made:

Ophir Mining Co., Washoe Valley,  
San Marcial Co., Mexico.

John D. Winters & Co., Esmeralda,

Crown Point Co., Gold Hill.

Potosi Mining Co., Virginia City,

Tajo Mining Co., Mexico.

Sheba Mining Co., Humboldt.

Lotta Mills Co., Coso.

American & Mexican Co., Mexico.

San Carlos Mining Co., Owen's River,

Union Quartz Co., Aurora,

Triunfo Mining Co., Mexico,

Napa Quartz Co., Aurora,

Petaluma Quartz Co., Gold Hill,

Francis Mellus & Co., Slate Range,

W. R. Churchill & Co., Mexico,

Willow Springs Co., Coso,

Hewes, Howe & Co., Rich Gulch Flat,

F. A. Benjamin & Co., Mexico,

O. J. Parker & Co., Nicaragua,

Gibbons & Clayton, Esmeralda,

Smith & Clouser, S. F. Reduction Works.

Amagoza Mining Co., San Bernardino,

## MANUFACTURED ONLY BY

## GODDARD &amp; CO.,

At the Pacific Iron Works.

SAN FRANCISCO.

os 125 to 136 First street, and 126 to 144

Fremont street.

P. DONAHUE, H. J. BOOTH, C. S. HIGGINS.

UNION  
IRON AND BRASS FOUNDRY.

(The First Established in the State.)

CORNER OF FIRST AND MISSION STREETS, SAN FRANCISCO.

HAVING ADDED TO THE SEVERAL Departments all the recently improved Tools, this Establishment is now the most Extensive and Complete of any on the Pacific Coast.

The undersigned are prepared to furnish, at short notice, Locomotive, Marine and Stationary Engines, of every size and description.

## BOILERS.

Locomotive, Flue, Tubular, Upright and Cylinder, furnished with or without engines, complete.  
Machinery and Castings of every description, Saw-mills, Grist Mills, Car Wheels, Derrick Irons, etc.

QUARTZ CRUSHING BATTERIES,  
Embracing a great variety of Stamp, Mortar and Cam Patterns.

AMALGAMATING MACHINERY,  
Varney's Improved Patent Pans and Settlers, Wakely Pans, Amalgamating Tubs, Plaisted's Grinders, Chile Mills, Concentrators, etc., etc.

## MINING PUMPS.

Cornish, Lift and Force Pumps, from four to eight feet stroke, with Pipes, Bob Mountings, and Gearing complete.

## HOISTING DRUMS.

For Shafts or Inclines, with clutch, friction or V cones. Sole Agents and Manufacturers for the Pacific Coast, of C. and G. M. Woodward's Celebrated Patent Safety Steam Pumps and Fire Engines.

All Contracts and Orders executed with promptness and dispatch, and at reduced prices for Cash.

jc21 DONAHUE, BOOTH, & CO.

## Giffards Injectors,

FOR SUPPLYING BOILERS WITH FEED WATER without Pumps No Mill or Mining Company should be without one of these valuable instruments. Send for a Circular.

jc22 Cor. Pine and Front Sts., San Francisco.

I. C. E. KLEPZIG & CO.,  
GUN MAKERS,  
...AND...  
DEALERS IN GUN MATERIALS,

733 Washington street, San Francisco,  
[One Door above Kearney street.]

Repairing done in a workmanlike manner at the shortest notice.

Gilding, and also Silver Plating, by E. Eklaud. jc21

CORNELL'S  
EXCELSIOR GALLERY,

650 Washington st. Three doors below Kearny.

Having refitted the above rooms the undersigned is now prepared to furnish the public with a superior style of Picture, at a lower price than ever before offered in the city.

## CARD PICTURES.

As I have every facility for producing these beautiful pictures, in all their different varieties, I have reduced the price to

\$3 PER DOZEN and \$2 PER HALF DOZEN!

Large size Photographs. \$3—Extra copies \$1 each

AMBEROTYPES in all Styles and Prices.

OLD PICTURES copied with care and accuracy, in any style desired, Particular attention paid to pictures of Children.

Pictures painted in Oil or Water Colors, and retouched in India Ink by a competent artist.

jc22 R. H. CORNELL.

## BAUNCHEIDTISM,

THE PRESERVER AND PRODUCER OF LIFE.

THE EFFECT OF BAUNCHEIDTISM AS A METHOD OF curing disease, is a "fait accompli" in medicine, and needs no more proof. The public has crowned Bauncheidtism already with an extraordinary patronage, and it is acknowledged by all men of science that BAUNCHEIDTISM is founded on a rational, scientific basis.

It can safely, and with sure success be applied to paralysis in consequence of Apoplexy, Palsy and Rheumatism of every description, which kind of complaints can find their only relief by the above method.

Especially can it be applied successfully, in the spring of the year to diseases of the eye.  
Dr. Borchers is the only doctor in California who has the original series of Dr. BAUNCHEIDT and his original oil. Dr. Borchers is also in possession of original letters of the inventor of the method by which he can prove that he is perfect master of the latter.

DR. J. C. BORCHERS.

No. 19 Kearney street, and No. 4, Mark's Place, First story, No. 5. Office hours from 9 to 11 A. M., and 1 to 4, and 7 to 9 P. M. jc21

## REYNOLDS' Patent Cut-Off and Governor FOR STEAM ENGINES.

127 of these Invaluable Machines, ARE NOW IN USE In California and Nevada Territory, giving a perfect regular motion and Saving 20 to 65 per cent of the Fuel.

## Steen's Improved Governor

Is the CHEAPEST, SIMPLEST and QUICKEST to set and least liable to get out of order of any Governor in use. It can be seen in operation at the Golden State Works, and at the Stone Breaker, foot of Market Street, San Francisco.

## Clark's Steam and Fire Regulator

For controlling the Draft or Blast by opening the Chimney or Valve in the Blast Pipe by the pressure of steam in the boiler. It will regulate the pressure of steam, on the square inch. It cannot get out of order and any person can put one up in an hour after the design is put in.

## Ingersoll's Patent Drill Press,

With which drilling can be done the same as with common ratchet, and when small holes are wanted can be done four times as fast. The handle can be used in any direction.

## Felt for Steam Boilers, Pipes, Etc.

At the lowest market rates.

## Steam Engines, Boilers, Pipes,

Hydraulic Presses, Shafting, Pulleys, Etc., at the lowest market rates.

## Anti Incrustation Powder,

A Sure Remedy for Scale in Steam Boilers, without injury to the iron. In use for the past EIGHT years. Refer to—Sugar Refinery, San Francisco,

Cottell & Co., San Jose,  
L. A. Booth Esq., Virginia City,  
and 2,000 others in the United States.

E. T. STEEN AGENT

No. 33 Fremont Street, San Francisco

## The Pacific Mineral Company

MAKE LIBERAL ADVANCES UPON THE ORES OF

COPPER, SILVER, TIN, NICKEL, COBALT, ZINC,

LEAD, AND SULPHURETS CONTAINING GOLD.

Due account taken of all valuable metals combined with Silver and Copper Ores, and advances made therefor.

Parties owning undeveloped mines and desiring capital to prospect the same will receive assistance, if, upon examination, such lands are deemed sufficiently valuable to justify such expenditure.

OFFICE, No. 1, ODD FELLOWS' HALL.

jc14f Montgomery Street, San Francisco

## To Mining Companies about to incorporate.

JOHN ARMSTRONG,

CONVEYANCER,

610 Merchant Street,

San Francisco

Is Prepared to draw with Accuracy and Dispatch

Certificates of Incorporation—Trust Deeds

and all other Papers,

necessary to the correct Incorporation of Mining

companies, on reasonable terms.

All letters of enquiry cheerfully and promptly

were. Address as above.

## New Style of Ladies' Buckle

W. BOHM,

INVENTOR AND PATENTEE.

THE SUBSCRIBER HAVING OBTAINED LETTERS PATENT from Washington for an improvement in the construction of Ladies' Buckles, is now ready to furnish the same in every variety of style. This possesses several very important improvements over other in use.

The invention having been carefully examined by Patent Office, has been adjudged to be a useful invention, and Letters Patent have been granted for 17 years. It excels all other buckles in

Usefulness, Strength and Appearance.

The Public is respectfully invited to call and examine this Buckle at the Jewelry Establishment of

BRAYMAN & LEVY

621 Washington Street, San Francisco

JOSEPH, BROTHIE

607 Montgomery Street, San Francisco

FLORES & CONRY

118 I Street, Sacramento

Agents for the Patent

Every Buckle sold, stamped "W. Bohm,"

guaranteed as to its Strength and Durability.

jc27 W. BOHM, Patentee.

WILLIAM BRODIE & CO.,
